EXECUTIVE SUMMARY

R. W. Beck, Inc. (“R. W. Beck”) was retained by Central Minnesota Municipal Power Agency (“CMMPA”) to develop a load forecast and resource expansion analysis for the thirteen municipal utilities that CMMPA is representing in the Big Stone II Project certificate of needs filings in the states of Minnesota and South Dakota. CMMPA, collectively with six other owner-participants in the Big Stone II Project, submitted its application for a certificate of need in the State of Minnesota on September 30, 2005 (the “Application”). The analyses undertaken by CMMPA in support of the Application were reviewed by the Minnesota Department of Commerce (“DOC”), which recommended that certain aspects of the analyses and supporting documentation submitted by CMMPA in the Application be revised. The DOC provided certain recommendations to improve the analysis conducted by CMMPA, which, to paraphrase the DOC recommendations, suggested that CMMPA redress two primary areas of the analysis: (i) the techniques used to develop the load and demand forecast should be more comprehensive, and (ii) a more rigorous optimization technique should be used to examine potential resource expansion plans. This report addresses these recommendations.

On behalf of CMMPA, R. W. Beck performed two interrelated studies, which results are summarized and the methodology and assumptions are documented herein. These studies were:

- A econometric forecast of demand and energy for each of the municipal electric systems of which CMMPA is representing in the Application; and
- A resource expansion analysis, incorporating the results of the load forecast, using an industry-accepted resource expansion optimization software program.

These analyses were conducted for a composite of thirteen municipal electric systems located in the southern and central portions of the State of Minnesota that have elected to participate jointly through CMMPA to acquire an undivided ownership interest in the proposed construction and operation of the Big Stone II Project. Twelve of these entities are current members of CMMPA:

| | |
|---|---|
| City of Blue Earth, MN (“Blue Earth”) | City of Kasson, MN (“Kasson”) |
| City of Delano, MN (“Delano”) | City of Kenyon, MN (“Kenyon”) |
| City of Fairfax, MN (“Fairfax”) | City of Mountain Lake, MN (“Mountain Lake”) |
| City of Glencoe, MN (“Glencoe”) | City of Sleepy Eye, MN (“Sleepy Eye”) |
| City of Granite Falls, MN (“Granite Falls”) | City of Springfield, MN (“Springfield”) |
| City of Janesville, MN (“Janesville”) | City of Windom, MN (“Windom”) |

The thirteenth entity included in the analysis is the City of Willmar, Minnesota, which though not a member of CMMPA, is participating jointly with the other twelve members of CMMPA to acquire an undivided ownership interest in the proposed Big

EXECUTIVE SUMMARY

Stone II Project. Throughout this report, these thirteen municipal electric systems are collectively referred to as the Big Stone II Members.

The results of the load forecast indicate that NEL and peak demands of the CMMPA Members are projected to grow at annual growth rates of approximately 1.5 percent over the twenty year period from 2006 through 2025. Primarily following the forecast trends for major economic indicators used to develop the forecast, load growth rates for the Big Stone II Members are projected to decline over time, with growth rates of approximately 1.6 percent over the first decade of the forecast period (2006 through 2015), declining to approximately 1.4 percent over the second decade of the forecast period (2016 through 2025). The annual coincident peak demand of the Big Stone II Members is projected to be 177 megawatts by the summer of 2011, the summer immediately following the anticipated commercial operating date for the Big Stone Unit II.

Assuming a 15 percent planning reserve margin is applied to the forecast of coincident peak demands for the CMMPA Members, the members are first in need of capacity additions in 2008. Capacity deficiencies in 2008 are projected to be rather small (less than 2 megawatts), and capacity needs are projected to increase only slightly in 2009 as certain purchase power contracts are set to expire and other planned resources are scheduled to come online. However, by 2011, without the addition of the Big Stone Unit II, the reserve margin for the CMMPA Members is projected to fall below 10 percent. Capacity needs are projected to grow by an average of 3.5 megawatts per year thereafter. By 2025, if no capacity other than currently planned amounts is added, the CMMPA Members would need approximately 58 megawatts of capacity additions.

To satisfy this projected need, a resource expansion analysis was undertaken to identify a least-cost resource plan. Over 400 potential expansion plans were developed in the resource expansion analysis. The three plans that ranked lowest in present value cost were identified as the optimum least-cost plans as shown in Table ES-1. The present value utility cost variance shown in the table represents the incremental cost increase for each plan from the lowest-cost plan. All three of the optimum least-cost expansion plans indicate that the Big Stone II Members need to secure 30 MW of Big Stone Unit II capacity in 2011.

- Plan 1, consisting of the planned 30 megawatts of the Big Stone Unit II in 2011, plus an additional 10 megawatts of installed wind capacity in 2011, followed by 10 megawatts of supercritical pulverized coal capacity installed every two to three years beginning in 2019, was found to be the least-cost potential resource expansion plan. Based on the results of this plan, wind turbine capacity of approximately 10 MW is a viable resource option for the Big Stone II Members in 2011. This amount of wind capacity is approximately equal to the Renewable Energy Objective of the Big Stone II Members for 2012.
- Plan 2 delays the installation of the 10 MW wind unit 9 years until 2020 and moves the first 10 MW supercritical coal unit one year forward to 2018. The incremental cost increase from Plan 1 was less than \$1 million.

EXECUTIVE SUMMARY

- Plan 3 differs from Plan 1 by replacing the final 10 MW of supercritical coal capacity addition in 2035 with 10 MW of IGCC capacity. The incremental cost increase from Plan 1 was \$3.4 million.

Table ES-1: Optimum Least-Cost Potential Expansion Plans

| Year of Installation | Plan 1 | Plan 2 | Plan 3 |
|--|-----------------------------|---------------|-----------------------------|
| 2011 | BS II (30MW) Wind (10MW) | BS II (30MW) | BS II (30MW) Wind (10MW) |
| 2018 | — | Coal (10MW) | — |
| 2019 | Coal (10MW)) | — | Coal (10MW) |
| 2020 | — | Wind (10MW) | — |
| 2021 | Coal (10MW) | Coal (10MW) | Coal (10MW) |
| 2023 | Coal (10MW) | Coal (10MW) | Coal (10MW) |
| 2026 | Coal (10MW) | Coal (10MW) | Coal (10MW) |
| 2029 | Coal (10MW) | Coal (10MW) | Coal (10MW) |
| 2032 | Coal (10MW) | Coal (10MW) | Coal (10MW) |
| 2035 | Coal (10MW) | Coal (10MW) | IGCC (10MW) |
| PV Utility Cost Variance (2006 \$000) | - | 954 | 3,400 |

At least 30 additional megawatts of capacity from Big Stone Unit II could be cost-effectively added by the Big Stone II Members in 2011. This case is not currently contemplated as a resource expansion alternative because all of the proposed Big Stone Unit II capacity is already allocated to the Big Stone II partners. However, should additional capacity from the Big Stone Unit II become available, the resource expansion analysis found that additional quantities of the Big Stone Unit II capacity would provide for lower total present value costs for the Big Stone II Members as compared with the lowest-cost base plan described previously. While the reserve margin for the Big Stone II Members would obviously far exceed the 15 percent target under this case, the lower-cost results of this case can be understood when compared to the existing resource alternatives of the Big Stone II Members. The Big Stone II Members rely heavily on market-priced non-firm and economy purchases, and generation from owned, lower-efficiency steam resources, and oil-fired diesel generation to serve their loads. In contrast, savings in energy costs the Big Stone II Members could receive through low-cost energy available from the proposed Big Stone Unit II are projected to offset the incremental fixed and capital costs associated with the additional Big Stone Unit II capacity, resulting in lower total costs for power than what is available from their existing resources.

CONCLUSIONS

The resource expansion modeling demonstrates that growth in member and changes in planned capacity results in the need for new capacity additions for the Big Stone II Members in the near future. To meet this need, the Big Stone II Members will need to acquire new capacity resources. Evaluations of available and possible resource alternatives indicate that Big Stone Unit II is a viable, low-cost means for the Big Stone II Members to meet this need. Furthermore, the beneficial results produced by acquiring 30 MW of Big Stone Unit II capacity above the current allocation of the Big Stone II Members underscores the need of the members to obtain low-cost, base-loaded capacity.

Section 1

INTRODUCTION

DESCRIPTION OF CMMPA

Central Minnesota Municipal Power Agency (“CMMPA”) is a not-for-profit municipal corporation and political subdivision of the State of Minnesota, headquartered in Blue Earth, Minnesota. CMMPA was formed in 1987 and currently has 14 members (the “Members”), as listed below.

- City of Blue Earth, MN (“Blue Earth”)
- City of Delano, MN (“Delano”)
- City of Fairfax, MN (“Fairfax”)
- City of Glencoe, MN (“Glencoe”)
- City of Granite Falls, MN (“Granite Falls”)
- City of Janesville, MN (“Janesville”)
- City of Kasson, MN (“Kasson”)
- City of Kenyon, MN (“Kenyon”)
- City of Lake Crystal, MN (“Lake Crystal”)
- City of Mountain Lake, MN (“Mountain Lake”)
- City of New Ulm, MN (“New Ulm”)
- City of Sleepy Eye, MN (“Sleepy Eye”)
- City of Springfield, MN (“Springfield”)
- City of Windom, MN (“Windom”)

CMMPA is responsible for supplying project power to the Members, who in turn provide low-cost, reliable electric energy and related services directly to customers across south and central Minnesota. Utilities Plus, a power marketing company wholly-owned by CMMPA, assists the Members with the purchase and sale of capacity and energy on a short term or other basis, as requested, and arranges for transmission services for such purchases and sales. The Members rely on Utilities Plus to dispatch the various member resources together with purchases from the market to minimize their total power costs.

CMMPA is a project agency and, as such, CMMPA members determine individually which projects to pursue. Twelve of the CMMPA members – namely, Blue Earth, Kasson, Delano, Kenyon, Fairfax, Mountain Lake, Glencoe, Sleepy Eye, Granite

Section 1

Falls, Springfield, Janesville, and Windom – have elected to participate jointly through CMMPA to acquire an undivided ownership interest in the proposed construction and operation of the Big Stone II Project. Additionally, the City of Willmar, Minnesota, which is not a member of CMMPA, is participating jointly with these twelve members of CMMPA to acquire the undivided ownership interest in the Big Stone II Project. The twelve CMMPA members and the City of Willmar have signed a power sales agreement with CMMPA to acquire a collective 5.0 percent (approximately 30 MW) ownership interest in Big Stone Unit II.

Throughout this report, the thirteen municipal electric systems are collectively referred to as the Big Stone II Members. All of the loads of CMMPA Big Stone II Members are served in Minnesota.

DESCRIPTION OF THE PROJECT

Big Stone Unit II is a second generating unit planned for construction adjacent to Otter Tail Power Company’s (“Otter Tail”) Big Stone Unit I located near Big Stone City, South Dakota. The Big Stone II Project (the “Project”) entails the construction of the Big Stone Unit II and associated transmission facilities. The six utilities currently participating in the development of the Project along with CMMPA are Otter Tail, Great River Energy, Heartland Consumers Power District, Missouri River Energy Services, MDU Resources Group, and Southern Minnesota Municipal Power Agency (the “Participants”). The Big Stone Unit II is assumed to be a supercritical pulverized coal unit with a total generating capacity of approximately 600 MW. Subject to permitting, commercial operation is scheduled for the spring of 2011.

PURPOSE OF THE ANALYSIS

CMMPA, along with the other Participants, is in the process of filing for a Certificate of Needs for the Project in the state of Minnesota. In accordance with Minnesota Public Utility Commission Rule 7849, one of the requirements for receiving a Certificate of Need involves the demonstration that the Project (or portion thereof, depending on what facilities are located within the state) is the lowest cost option for meeting future power supply requirements. The resource expansion analysis documented herein (the “Analysis”) is intended to provide the documentation necessary to show that the Project is the lowest cost resource alternative for the Big Stone II Members.

OBJECTIVES

The resource planning objectives of the Big Stone II Members adopted for this analysis are as follows:

- ***Objective 1:*** Maintain the adequacy and reliability of power supply. To meet this goal, load projections were first developed for the Big Stone II Members, including an additional 15% for planning reserves. Current plans for

resource additions and retirements were then reflected in the analysis. Based on these investigations, the Big Stone II Members are projected to begin experiencing capacity deficiencies by the summers of 2008. Short-term capacity purchases could cover deficiencies early on, but load growth and additional purchase power contract terminations are projected to cause capacity deficiencies to gradually increase over time.

- ***Objective 2:*** Keep CMMPA wholesale rates as low as possible. One of the primary objectives of the Analysis was to analyze potential resource plans that would minimize the overall long-term power supply costs to the Big Stone II Members. Resource expansion modeling was performed to identify the resource plan(s) that are projected to produce the lowest present value generation production, fixed, and capital costs for the Big Stone II Members. The analysis examined various potential resource combinations over the 2011 through 2035 timeframe.
- ***Objective 3:*** Minimize adverse socioeconomic and environmental effects. The resource expansion analysis utilized Commission-approved environmental externality prices and considered expected costs for mercury and SO₂ allowances when computing the least-cost plan. Additionally, wind resources and demand-side management (“DSM”) programs were analyzed during the analysis of resource expansion alternatives.

METHODOLOGY

The Analysis was comprised of two primary components, which are summarized below and documented more fully in the following sections of the report.

LOAD FORECAST

A forecast of peak load and net energy requirements for the Big Stone II Members was developed for a 20 year period, beginning fiscal year 2006 through 2025. The load forecast utilized generally-accepted electric utility industry practices to develop separate projections of net energy load for each of the Big Stone II Members. Historical data and forecasts of major economic indicators such as population, gross domestic product, retail sales, and personal income for the Minnesota counties of the Big Stone II Members were combined with historical heating and cooling degree-day weather indicators and projections of normal weather conditions to develop the annual projections. These annual NEL projections were assessed in the context of other historical information on annual peak demands and monthly and hourly loads to develop projections of monthly energy and peak demands and a coincident peak demand forecast for the Big Stone II Members.

RESOURCE EXPANSION ANALYSIS

A resource expansion analysis was performed using the dynamic programming optimization feature of New Energy Associates’ Strategist® software package.

Section 1

Potential resource plans developed in the Strategist software were ranked based on the present value total generation production costs and incremental fixed O&M and capital costs for new resource additions. Present value costs were computed over a 25 year planning horizon (2011 through 2035, the "Planning Period"), with end effects being computed for an additional thirty years beyond the Planning Period. Unless currently scheduled for retirement, the existing Big Stone II Member resources were assumed to remain available over the Planning Period. Generic generating resources and the Big Stone II Member portion of the Big Stone Unit II were modeled and made available for Strategist to select from when meeting future capacity and energy requirements.

PRINCIPAL CONSIDERATIONS

In preparing the Analysis, as summarized in this report, we have made certain assumptions with respect to conditions that may occur in the future. These assumptions primarily relate to economic, demographic, weather, commodity price, and costs conditions. With regard to certain of these factors, we have relied upon information provided to us or prepared by others. While we believe the assumptions made by us in preparing the Analysis are reasonable for the purposes of the forecast and projections herein, they are dependent on future events, and actual conditions may differ from those assumed. While we believe the sources of the information provided to us, or prepared by others, to be reliable and the use of such information to be reasonable for the purposes of the forecast and projections herein, we offer no other assurances with respect thereto.

To the extent that economic, demographic, weather, commodity price, costs, or other conditions occur that are different from those assumed by us or from the information provided to us or prepared by others, actual events can be expected to vary from the forecast and projections herein. It should be emphasized that the confidence associated with any forecast varies inversely with the length of the forecast horizon. The probability of other factors affecting forecasted values increases with uncertainty about future developments; this uncertainty increases with the length of the forecast horizon. With this in mind, the Analysis should be seen as providing reasonable estimates of future demand events for the purposes for which the Analysis is intended; which estimates are subject to the future effects of factors that cannot be reasonably foreseen at this time.

Section 2

LOAD FORECAST

OVERVIEW

R. W. Beck has prepared a forecast of peak load and net energy requirements for the Big Stone II Members (“2006 Load Forecast”). A load forecast is a critical input to many utility processes including, but not limited to, generation resource planning, fuel and purchased power budgeting, transmission planning, and financial planning and budgeting. In addition, this forecast constitutes a critical part of Resource Expansion Analysis and Certificate of Need filings of CMMPA in support of the Big Stone II Project. Consequently, a rigorous forecasting process which relies on recognized standards of practice, high quality data, and a thorough review of results by various parties is essential to operations and long-term planning.

The 2006 Load Forecast has been prepared for a 20 year period, beginning fiscal year 2006 through 2025. The Forecast relies on annual, monthly, and hourly load data that were obtained from CMMPA staff and supplemented by Energy Information Administration Form 861 records. Historical and projected economic and demographic data for the counties that surround the Big Stone II Members were provided by Economy.com, a nationally-recognized provider of such data. Beck has also relied on CMMPA staff for information regarding local economic developments and other issues specific to each Big Stone II Member. Weather data was provided by the National Oceanic and Atmospheric Administration (“NOAA”) for the Minneapolis-St. Paul airport weather station, a National Weather Service office in close proximity to all of the Big Stone II Members.

The results of the Forecast imply that the total energy requirements of the Big Stone II Members is expected to grow at an annual average rate of 1.6 percent from 2006-2015 and 1.4 percent from 2016-2025. On a normal weather basis, the projected total energy requirements and coincident peak for 2006 are 770 GWh and 162.9 MW, respectively. The aggregate coincident peak of the Big Stone II Members typically occurs in the summer, and more often in July than other summer months.

FORECAST METHODOLOGY

The 2006 Load Forecast relies on a bottoms-up approach in which forecasts of the Big Stone II Members are prepared independently and summed to represent the total of the Big Stone II Members. The following sections provide some detail regarding the analytical steps and calculations that were involved in producing the results.

Section 2

Forecast of Energy Requirements

A forecast of the annual energy requirements of each Big Stone II Member was developed based on an econometric model that generally utilized historical data over the period 1990 through 2005. All other forecasted load determinants (e.g., monthly energy requirements, monthly and annual peak demand, etc.) are derived from annual energy requirements. Thus, annual energy requirements are the only directly-forecasted load determinant.

Econometric forecasting makes use of regression to establish historical relationships between energy consumption and various explanatory variables based on fundamental economic theory and experience. In this approach, the significance of historical relationships and validity of resulting models are evaluated using commonly accepted statistical measures and tests (e.g., standard error, adjusted R-squared, Schwarz Information Criterion, Ljung-Box test, etc.). Models that, in the view of the analyst, best explain the historical variation of energy consumption are selected. These historical relationships are generally assumed to continue into the future, barring any specific information or assumptions to the contrary. The selected models are then combined with projections of the explanatory variables, resulting in a projection of energy requirements.

Econometric forecasting can be a more reliable technique for long-term forecasting than trend-based approaches and other techniques, because the approach results in an explanation of variations in load rather than simply an extrapolation of history. As a result of this approach, utilities are better able to anticipate departures from historical trends in energy consumption, given accurate projections of the driving variables. In addition, understanding the underlying relationships which affect energy consumption allows utilities to perform scenario and risk analyses, thereby improving decisions.

Econometric modeling was not done nor were forecasts developed at the retail sales level for the Big Stone II Members as data of sufficient detail or of a sufficiently lengthy historical period were not available for such an analysis. In addition, it was felt that any available data was unlikely to be of a high enough quality to support a rigorous analysis.

Similarly, although R. W. Beck recognizes that the price of electricity and of alternative fuels may have an impact on electric usage, data was not sufficiently available to support an extension of the econometric models in that regard. Moreover, any impact that might occur from potentially higher electricity prices are believed to be small and to occur over a long period, such that the forecast would be unlikely to be affected significantly.

Model Specification

The general form of the regression equations used in the 2006 Forecast is typically referred to as a double-log transform. In this functional form, the dependent variable is the natural log of the series of interest, in this case energy requirements for each of the Big Stone II Members, expressed as a function of the natural log of some or all of the explanatory variables. This formulation accomplishes three objectives:

1. It allows for the multiplicative combination of factors that tend to affect electric usage in an interactive way (e.g., the amount of living area under space conditioning and ambient temperature),
2. It guarantees constant elasticity (defined below) through time, and
3. It allows for a direct comparison of model parameters among segments of the study and against economic theory (e.g., price elasticity of demand is typically between 0 and -1, or inelastic).

Elasticity is measured by the percentage change in the variable being explained (e.g., energy requirements) that results from a one percentage change in the value of a given explanatory variable. Elasticities represent useful shorthand for understanding the impact of the external variables on energy requirements and are directly comparable among the Big Stone II Members. For example, the model coefficient on cooling degree days should be similar among the Big Stone II Members. Significant variations in the weather coefficients should be a function of differences in customer characteristics for the most part and/or may alert the forecast analyst to data quality issues.

Frequently, theory or evidence does not support constant elasticity across the range of values for an explanatory variable. In those cases, however, an effort should be made to explicitly derive a relationship that is consistent with theory and fits the data well. The double-log transform sometimes results in an improvement in load forecasting equations simply by avoiding the potential problem of instability in the estimated impact of explanatory variables across time due to the fact that electric load typically grows through time. Coefficients on weather variables in a strictly linear model, for example, may tend to under-represent the influence of weather as load grows.

Table 2-1 below shows the variables used and the estimated parameter of each variable in the forecast model of each Big Stone II Member's energy requirements, where:

GDP = gross domestic product in the county surrounding the Member

PY = total personal income in the county surrounding the Member

RETSAL = total retail sales in the county surrounding the Member

CDD = cooling degree days for the Minneapolis-St. Paul airport

HDD = heating degree days for the Minneapolis-St. Paul airport

Year>2004 = a binary variable set to 0 for 1990-2003 and 1 for 2004

AR(1) = an auto-regressive term providing a correction factor based on prior-year model residuals.

Section 2

Table 2-1: Summary of Estimated Forecast Model Parameters for Big Stone II Members

| Member | GDP | PY | Retail Sales | Estimated Parameters | | Year > 2003 | AR(1) |
|---------------|------|------|--------------|----------------------|---------------------------|-------------|-------|
| | | | | CDD | x10 ⁻⁵ [1] HDD | | |
| Blue Earth | 0.52 | | | 8.57 | 2 60 | | |
| Delano | | | 0.95 | 7.57 | | | |
| Fairfax | 0.16 | | | 2.73 | 5.35 | | |
| Glencoe | | 1.15 | | 10.74 | 3.05 | (0.12) | |
| Granite Falls | | 0.34 | | 8.99 | 1.68 | | |
| Janesville | | | 0.70 | 15.60 | | | |
| Kasson | | 1.21 | | 11.47 | 5.39 | | |
| Kenyon | | 1.13 | | 8.86 | 2.34 | | 0.57 |
| Mountain Lake | 0.84 | | | 34.03 | | | |
| Sleepy Eye | 0.49 | | | 8.91 | 1.44 | | |
| Springfield | | | 0.60 | 13.92 | | 0.06 | |
| Willmar | | 1.01 | | 6.59 | 3.52 | | |
| Windom | 0.28 | | | 7.68 | | | 0.87 |

[1] Weather coefficients reflect the estimated percentage change in energy requirements from a one point change in degree days rather than from a percentage change in degree days.

The economic variable used in each model was chosen on the basis of the best statistical results, as measured by adjusted R-squared and Schwarz Information Criterion, and the most sensible resulting forecast, in consultation with CMMPA staff. The binary variable above, YEAR>2003, was added in the case of Glencoe to account for the loss of a major industry in 2004 and in the case of Springfield to account for an increase in energy requirements that could not be accounted for by other variables. While the use of such an adjustment is somewhat ad hoc, it should be recognized that the forecast team had very little information regarding the activity of large industrial customers that make up a large portion of the retail load of some Big Stone II Members. In addition, the economic data on which these models are estimated are subject to potentially large revisions on a significantly lagged basis, up to 5 years or more. Hence, late-period residuals can be caused by inaccurate estimates of the economic data during those periods.

In the case of Mountain Lake, the forecast reflects an upward adjustment in the level of energy requirements throughout the forecast horizon to avoid a large negative differential between the last historical data point and the forecast. This differential is due to the impact of weather normalization and the abnormally large coefficient on cooling degree days (shown in the table above), as the last historical year has significantly higher cooling degree days than normal. While there may be higher cooling load on Mountain Lake's system as a result of some industry with refrigeration requirements, for example, it was felt that the abnormally large coefficient was more likely a function of the timing of residuals associated with the city's small size and relatively large industrial load.

Appendix A contains the model estimation output for each of the Big Stone II Members. These tables are preceded by a key defining abbreviation and variable name conventions used throughout the appendix. The energy requirements data and explanatory variables are shown in detail in Figures 2-1 and 2-2 and Tables 2-2 through 2-8, which are located at the end of this section. In addition, Appendix B

contains the full detail of net energy for load and peak demand forecast results by individual Big Stone II members.

Projection of Monthly Peak Demand

Projections of summer and winter non-coincident peak (“NCP”) demand for each Big Stone II Member were developed by applying projected annual load factors to forecasted energy requirements. The projected load factors are generally based on the average relationship between annual energy requirements and the seasonal peak demand generally over the period 1996-2005 (i.e., a 10-year average).

Monthly peak demand is based on the average relationship between each monthly peak and the appropriate seasonal peak. This average relationship was computed after ranking the historical demand data within the summer and winter seasons and reassigning peak demands to each month based on the typical ranking of that month compared to the seasonal peak. This process avoids distortion of the averages due to randomness as to the months in which peak weather conditions occur within each season. For example, a summer peak period can occur during July or August of any year. It is important that the shape of the peak demands reflects that only one of those two months is the peak month and that the other is typically some percentage less.

Each Big Stone II Members’ contribution to the total peak demand of the aggregate Big Stone II Members’ load (i.e., coincident peak demand) were derived from monthly NCP demand and assumed coincidence factors generally based on an average of such factors over a 5-year period (2001-2005). These historical coincidence factors are based on coincident peak demand data that was computed from hourly load data maintained by CMMPA. Hourly load data was not available prior to 2001. As a result, coincident peak demand and coincidence factor data was not available prior to 2001 to allow for a longer period of averaging of such factors.

DATA SOURCES

Historical Member Load Data

Historical annual energy requirements and summer and winter NCP demand were obtained from Energy Information Administration Form 861 reports for the period 1990-2004. Data for 2005 was obtained from CMMPA. Separate data on monthly energy requirements and peak demand was also obtained from CMMPA and was generally based on hourly load data maintained by CMMPA, supplemented in some cases by data provided by the Members. Given that the hourly load data was based on a SCADA system and was impacted in some cases by generation behind the metering point, this data was not used to forecast annual energy requirements and summer and winter NCP demand. Instead, it was only used to develop the monthly profile of energy requirements and peak demand. In addition, the hourly load data was analyzed and adjusted to correct for large deviations from sensible daily load patterns via the use of proxy historical daily profiles for days with similar weather conditions.

Section 2

Weather Data

Historical weather data was obtained from the National Oceanic and Atmospheric Administration for Minneapolis-St. Paul airport, a National Weather Service office in close proximity to all of the Big Stone II Members. Projected weather conditions are based on normal heating and cooling degree days most recently published by NOAA, which generally reflect average weather conditions over 1971-2000. Appendix C contains a table and a graphic showing historical and normal annual HDD and CDD used in the Forecast.

Economic Data

Economy.com, a nationally recognized provider of economic data, provided both historical and projected economic and demographic data. The data relied on includes economic and demographic data for the 11 counties in which the Big Stone II Members' service territories reside. These data include population, households, employment by major industry classification, personal income in total and by source, retail sales, and gross domestic product. Although all data was not necessarily utilized in each of the forecast equations, each was examined for its potential to explain variations in each Big Stone II Member's energy requirements.

Appendix D contains tables that provide the economic data relied on for this forecast, as well as representative growth rate statistics. A table is provided for each of the 13 Big Stone II Members, with the Member and county name shown at the top, but two of the tables are essentially duplicates as two of the Big Stone II Members reside in the same county.

PRINCIPAL CONSIDERATIONS AND ASSUMPTIONS

The development of the 2006 Load Forecast was based upon the following principal consideration and assumptions:

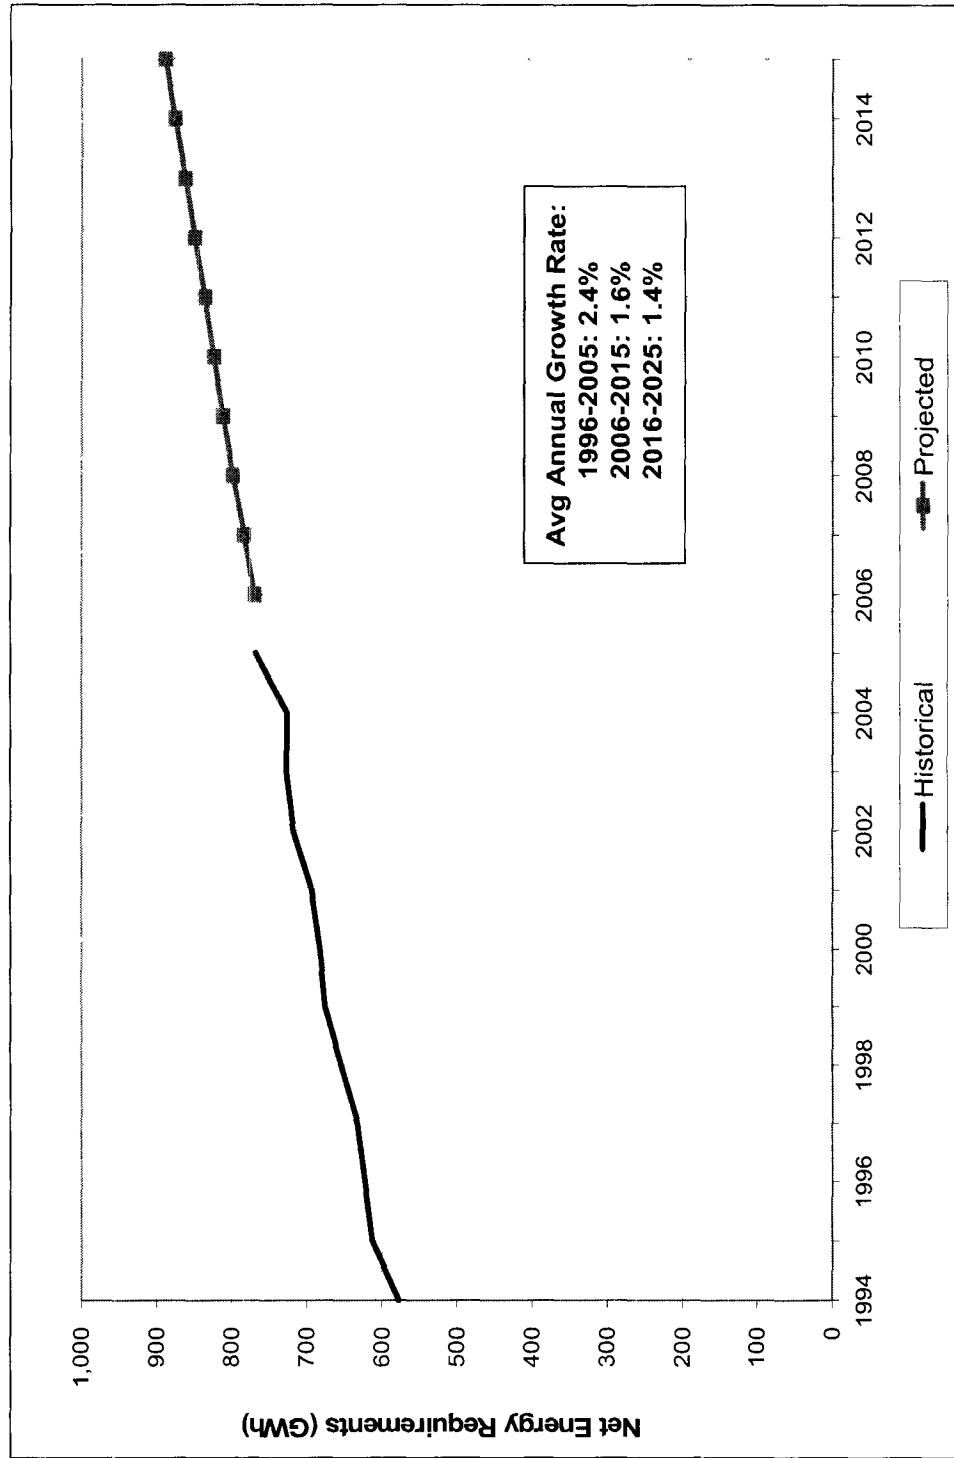

- The service territories of the Big Stone II Members will continue to experience moderate economic growth in a relatively stable economy.
- The future influence on energy requirements of the economic, demographic, and weather factors, on which the econometric models are based, was assumed to be similar to the estimated influence of such factors generally over the period 1990 through 2005.
- Although the econometric models implicitly account for the historical relationships between energy usage and the following factors to the extent they have occurred in the past, the 2006 Load Forecast does not explicitly reflect extraordinary potential future effects of: (a) increases in appliance design efficiency or building insulation standards; (b) development of substitute energy sources; (c) consumers switching to traditional or new types of electrical appliances from other alternatives (e.g., electric vehicles); (d) consumers switching from electrical appliances to other alternatives; or (e) variations in load that might result from legal, legislative, regulatory, or policy actions.

LOAD FORECAST

- To the extent the Big Stone II Members have affected their load characteristics or growth through load management, conservation, rate setting, or economic development programs in the recent past, such effects are implicitly reflected in these results based on the modeling techniques used in the 2006 Load Forecast. However, we have not assumed or modeled any additional impacts of existing or new load control or load enhancement programs.
- The recent average historical relationships between annual summer and winter non-coincident demands and annual energy requirements and between monthly NCP demands and annual winter and summer NCP demands were assumed to represent reasonable approximations of such future relationships.

Note: Errors in the historical CP demand data can result in Participant CP demand greater than NCP demand. In those cases, coincidence factors have been capped at 100%.

Section 3

CURRENT RESOURCES AND FUTURE NEEDS

The following discussion provides a description of the Big Stone II Member power supply resources and a comparison to the projected coincident peak demand for the members.

GENERATION RESOURCES

Existing Generating Resources

Existing CMMPA generating resources fall into two categories, those owned by the individual Members and those for which CMMPA is the contracting agency. CMMPA is a project agency and, as such, CMMPA members determine individually which projects to pursue. The City of Willmar also owns its own generating resources. Capacity for project resources owned by CMMPA members that are not part of the Big Stone II Members have been excluded from the information presented herein.

Based on summer ratings, the existing generating capacity owned by the Big Stone II Members totals 153 MW in 2006. The majority of the generating resources are diesel/internal combustion units, with a combined 117 MW of capacity. The Big Stone II Members also own small amounts of combustion turbine, steam turbine, and hydro resources, with combined capacities of 16 MW, 19 MW, and 1 MW, respectively. Additionally, the Big Stone II Members have contracted for a 12.5 MW ownership interest in the Nebraska City 2 resource scheduled to come on line in the spring of 2009.

Purchase Power Resources

The Big Stone II Members rely on various purchase power contracts, as follows.

System Firm Purchases

The Big Stone II Members contract for a combined 30 MW of system-firm capacity and energy, including several hydro purchases from the Western Area Power Administration and two Full Requirements purchases from Northern States Power Company (“NSP”).

Firm Purchases

Blue Earth purchases 5 MW from Alliant and Granite Falls purchases approximately 0.6 MW from NSP.

Section 3

Non-Firm Purchases

Several Big Stone II Members purchase non-firm energy from NSP under various NSP-55 contracts and Sleepy Eye purchases energy and capacity from NSP under an A-15 contract, for which it is required to maintain backup capacity.

Wind Resources

In May 2006, Blue Earth began a 20 year purchase of approximately 2.5 MW of installed capacity from the Blue Breeze Wind Facility. CMMPA also currently purchases 6 MW from the Cedar Falls facility and 6.25 MW from the Wolf Wind Farm. In addition, CMMPA is scheduled to purchase 10 MW from the Jeffries Wind Energy Center beginning in 2007. Because CMMPA has purchased wind energy and capacity for the benefit of all of its members, the values presented in the following tables have been prorated to reflect the load ratio share of the Big Stone II Members only.

Of the approximately 17.5 MW of wind capacity that is under contract by the Big Stone II Members, approximately 3 MW is assumed to be available to help meet the summer peak demand of the Big Stone II Participants. The level of firm capacity assumed for wind resources is based on wind resource generation patterns estimated for these facilities and applying the capacity accreditation procedures proposed by MAPP for wind resources. Wind generating patterns assumed for this analysis were developed and provided by Global Energy Concepts, LLC, an internationally recognized wind energy engineering firm located in Seattle, Washington.

Capacity Ratings

For the purposes of this analysis, all capacity owned or contracted by the Big Stone II Members, regardless of current accreditation status, was assumed to be available to meet the planning requirements of the members. Capacity ratings were derived from available EIA 411 reports, URGE testing reports, and information provided by the Big Stone II Members. Table 3-1 contains a listing of capacity ratings for all Big Stone II Member generating resources, while Table 3-2 contains a listing of purchase power resource for the Big Stone II Members.

CURRENT RESOURCES AND FUTURE NEEDS

Table 3-1: CMMPA Generating Resources

| Line No. | Owner | Generating Station / Unit | Unit Type | Primary Fuel Type | Generator Nameplate Rating (KW) | | Net Capacity - KW | | Commercial In Service Date |

[1] Summer/Winter ratings for WAPA reflect current July/January contract values

[2] Capacity under Fairfax NSP full requirements service is equal to projected peak demand less WAPA purchases.

[3] Capacity under Kasson NSP full requirements service is equal to projected peak demand

[4] NSP-55 purchases provide non-firm energy with minimum must take provisions at 55% of Member load net of WAPA purchases

[5] Sleepy Eye A-15 purchase provides non-firm energy at 100% block purchase of 3 MW summer and 2 MW winter

Expected Generation Resource Retirements

At present, only one of the Big Stone II Members has a generating resource scheduled for retirement. Sleepy Eye is currently planning to retire its diesel Unit No. 3 effective January 1, 2007. All of the purchase power contracts, except for the hydro purchases from WAPA are scheduled for retirement over the Planning Period.

MEMBER DSM ACTIVITIES

CMMPA is a project oriented, wholesale provider of power to its members, and as such, CMMPA does not have any direct control over its members regarding the development and implementation of demand-side management programs. In accordance with Minnesota law, the members of CMMPA file reports with the DOC

CURRENT RESOURCES AND FUTURE NEEDS

regarding annual efforts made by the utility to implement conservation programs. CMMPA regularly encourages its members to engage in conservation programs and it is currently assisting its members with the development of an integrated SCADA and load management system. Table 3-3, summarizes the DSM programs currently being undertaken by the Big Stone II Members.

It is important to note that to the extent that historical levels of DSM (i.e., demand and energy reduction) have occurred and are reflected in the historical demand and energy data reported by the members, then the 2006 Load Forecast captures these effects in the econometric forecast equations presented herein. As such, the forecast load growth contained in this Analysis reflects continued growth in DSM demand and energy reductions in proportion to the projected load growth of the Big Stone II Members.

NEEDS FOR ADDITIONAL CAPACITY AND ENERGY

According to the coincident peak load forecast presented in the preceding section, the Big Stone II Member resources are adequate to meet its peak demand and a 15% planning reserve requirement until the summer of 2008. Capacity deficiencies in 2008 are projected to be small (less than 2 MW), and capacity needs are projected to increase only slightly in 2009 as certain purchase power contracts are set to expire and as the Nebraska City 2 project is scheduled to come on line. However, by 2011,

Section 3

without the addition of Big Stone Unit II, the reserve margin for the Big Stone II Members is projected to fall below 10 percent. Capacity needs are projected to grow by an average of 3.5 megawatts per year thereafter. By 2025, if no capacity other than currently planned amounts is added, the Big Stone II Members would need approximately 58 megawatts of capacity additions.

The following figures and tables illustrate the projected capacity needs for the Big Stone II Members. Tables 3-4 and 3-5 present the projected loads and capacity resources for the Big Stone II Members for the summer and winter seasons, respectively, over the period 2006 through 2025.

Figures 3-1 demonstrates the projected annual capacity shortfall for the Big Stone II Members during the summer season excluding capacity from Big Stone Unit II. Figure 3-2 shows the annual capacity shortfalls during the summer season including capacity from Big Stone Unit II.

Figures 3-3 and 3-4 provide graphical representations of the projected loads and capacity resources for the Big Stone II Members for the summer and winter seasons, respectively, over the period 2006 through 2025. These figures include the capacity from Big Stone Unit II.

Figure 3-5 shows the projected annual energy requirements for the Big Stone II Members for 2006 through 2025.

RESOURCE EXPANSION ANALYSIS

MODELING METHOD

R. W. Beck performed a Resource Expansion Analysis for the Big Stone II Members to determine the most cost-effective resource expansion plan alternatives that could satisfy the future energy and capacity needs of the Big Stone II Members. The analysis was performed using the Strategist® software package, licensed by New Energy Associates, a Siemens company. Strategist employs a dynamic programming optimization technique combined with a convolution generation dispatch process to approximate the operation of generating resources and power purchases and sales for electric utilities. Through the dynamic optimization process, Strategist explores all potential generation expansion plans that can be produced from a given set of resource alternatives and identifies the best candidate plans based on the planning objectives identified by the user.

Figure 4-1, below, depicts an overview of the Resource Expansion Analysis process. The initial step in the Analysis involved the development of various forecasts and assumptions, including the demand and energy forecast discussed in Section 2, fuel prices, capital and operating characteristics for generic resources, and economic assumptions. Operating characteristics for the Big Stone II Member resources, including generating units and power purchase contracts, to be modeled in Strategist were developed from information provided by the members. Future potential power supply alternatives were developed to provide a broad range of generating resource alternatives, including coal and natural gas fired generating technologies and wind technologies.

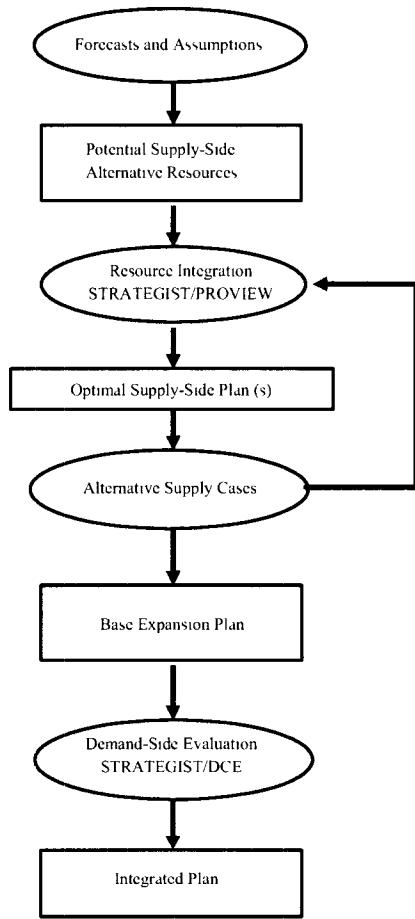

The alternatives were analyzed in Strategist along with the existing resources of the Big Stone II Members to determine the most cost-effective plan(s) the Big Stone II Members could pursue over the 25-year Planning Period (2011 through 2035). For the Analysis, two primary objectives were modeled in Strategist. First, the Big Stone II Members must meet a minimum 15 percent reserve margin beginning in 2011, and, second, the optimum potential resource plans must provide the lowest projected utility costs of all possible alternatives over the Planning Period. Potential resource plans were ranked from lowest to highest cost based on a computation of total, present value costs, including generation production costs, operating and maintenance costs, and capital costs for the CMMPA Members over the 25-year Planning Period. The Analysis also includes a quantification of capital and escalating costs beyond the study period, commonly referred to as end effects.

Unless currently scheduled for retirement, the existing Big Stone II Member resources were assumed to remain available over the Planning Period. Generic resources, as described in more detail in this section, and the Big Stone II Member portion of the

Section 4

Big Stone Unit II were modeled and made available for selection by Strategist when meeting future capacity and energy requirements.

Figure 4-1: Resource Expansion Analysis Process Overview

RESOURCE EXPANSION ALTERNATIVES

Several resource expansion alternatives were considered for the Big Stone II Members in the capacity expansion model. Table 4-1 summarizes the types of generating resource additions considered and their primary operating characteristics.

Operating characteristics for Big Stone Unit II were obtained from Otter Tail, and the capacity was based on the current allocation of the Big Stone II Members. In addition to the Big Stone Unit II, two generic, coal-fired resource technology options were modeled as expansion options in the analysis. These resource types – integrated gasification combined cycle (“IGCC”) and super-critical pulverized coal (“supercritical coal”) units – were made available as expansion alternatives beginning in 2011.

RESOURCE EXPANSION ANALYSIS

**Table 4-1: Big Stone Unit II and Expansion Resource Alternatives
Modeled Operating Characteristics**

| Fuel Type | | PRB Coal | Generic Resources | | | | |
|--|----------|----------|-------------------|------------|----------------|----------------|--------|
| | | | Big Stone II | F-Class GT | F-Class 2x1 CC | Super Critical | IGCC |

¹ Includes property taxes, insurance, and non-plant corporate expenses

Generic intermediate and peaking resources were considered in the expansion optimization analysis in the form of natural-gas fired resources: a simple-cycle F-class gas turbine resource and a two-on-one, F-class combined cycle resource.

A generic wind turbine, an intermittent and renewable resource, was also modeled as a resource expansion option to assist the Big Stone II Members in fulfilling their renewable energy benchmark requirements under the Minnesota Renewable Energy Objective.

All of the generic resource technologies were modeled in 10 MW increments under an assumption that the Big Stone II Members could acquire capacity through a partial ownership arrangement.

EXISTING RESOURCES

Unless currently scheduled for retirement, the existing Big Stone II Member resources were assumed to remain available over the Planning Period. Tables 4-2 and 4-3 below provide the basic operating characteristics as modeled for the generating resources and purchase power resources, respectively, for the Big Stone II Members.

Section 4

[1] Summer/Winter ratings for WAPA reflect current July/January contract values.

[2] Capacity under Fairfax NSP full requirements service is equal to projected peak demand less WAPA purchases.

[3] Capacity under Kasson NSP full requirements service is equal to projected peak demand.

[4] NSP-55 purchases provide non-firm energy with minimum must take provisions at 55% of Member load net of WAPA purchases.

[5] Sleepy Eye A-15 purchase provides non-firm energy at: 100% block purchase of 3 MW summer and 2 MW winter.

EMISSION COSTING

Effluents were modeled in Strategist to capture economic impacts of various emissions. The emission costs reflected in the Analysis for PM10, CO, NOx, lead, and CO₂ were obtained from the externality costs published by the Minnesota Public Utilities Commission (“PUC”) for *Within 200 miles of Minnesota* (or “MN200”) and *Rural*. The *Within 200 miles of Minnesota* values were applied to the operation of Big Stone Unit II, which is located in South Dakota. All other new resources were assumed to be constructed in rural areas of Minnesota and were applied the *Rural* values for emissions. The environmental externality values were adjusted from the 2004 values published by the PUC to 2006 values using a 2.4% general inflation rate, and are depicted below in Table 4-4.

SO₂ emission allowance costs were estimated assuming a market price of \$600 per ton in 2006 dollars, escalated over the Planning Period at 2.4%, and were applied to the amount of SO₂ emissions produced by thermal resources modeled in each potential expansion plan. Similarly, mercury emissions were assumed to be \$70 million per ton, or \$35,000 per pound, in 2006 dollars, escalated at 2.4%.

Section 4

Table 4-4: Estimated Minnesota Environmental Externality Values [1]

| | Rural | Within 200 Miles of Minnesota |
|-------------------------|------------|-------------------------------|
| PM ₁₀ \$/ton | 1,053 | 1,053 |
| CO \$/ton | 0.5 | 0.5 |
| NO _x \$/ton | 125.8 | 125.8 |
| Pb \$/ton | 552 | 552 |
| CO ₂ \$/ton | 3.82 | 0 |
| Mercury \$/ton | 70,000,000 | 70,000,000 |
| SO _x \$/ton | 600 | 600 |

[1] Amounts shown are in 2006 dollars

RESOURCE PLANNING RESULTS

The Strategist model developed over 400 potential expansion plans. The three plans that ranked lowest in present value cost were identified as the optimum least-cost plans as shown in Table 4-5. The present value utility cost variance shown in the table represents the incremental cost increase for each plan from the lowest-cost plan. All three of the optimum least-cost expansion plans showed that the Big Stone II Members need to secure 30 MW of Big Stone Unit II capacity in 2011.

- Plan 1, consisting of the planned 30 megawatts of the Big Stone Unit II in 2011, plus an additional 10 megawatts of installed wind capacity in 2011, followed by 10 megawatts of supercritical pulverized coal capacity installed every two to three years beginning in 2019, was found to be the least-cost potential resource expansion plan. Based on the results of this plan, wind turbine capacity of approximately 10 MW is a viable resource option for the Big Stone II Members in 2011. This amount of wind capacity is approximately equal to the Renewable Energy Objective of the Big Stone II Members for 2012.
- Plan 2 delays the installation of the 10 MW wind unit 9 years until 2020 and moves the first 10 MW supercritical coal unit one year forward to 2018. The incremental cost increase from Plan 1 was less than \$1 million.
- Plan 3 differs from Plan 1 by replacing the final 10 MW of supercritical coal capacity in 2035 with 10 MW of IGCC capacity. The incremental cost increase from Plan 1 was \$3.4 million.

Out of the over 400 potential expansion plans, four sub-optimal plans were selected for comparison purposes to demonstrate the effect of installing different technology types. The four selected sub-optimal plans are described in more detail below.

RESOURCE EXPANSION ANALYSIS

- Plan 56 reduced the amount of Big Stone Unit 2 coal capacity to 20 MW in 2011 and also included 30 MW of wind capacity added by 2016 and 10 MW of IGCC capacity in 2033. This plan reduced the total amount of supercritical coal capacity added and would produce fewer emissions than Plan 1; however, the incremental cost increase from Plan 1 was \$34 million, due to the addition of more capitally intensive technologies.
- Plan 66 has more additions in the first year of the Planning Period (50 MW, of which 30 MW is Big Stone Unit II capacity and the remaining 20 MW is wind capacity) than the lower cost expansion plans. It also includes 30 MW of total wind capacity added over the Planning Period. The incremental cost increase from Plan 1 was \$38 million.
- Plan 73 contains an installation of a combined cycle unit, at 10 MW, and also adds 40 MW of IGCC resources in the later years of the Planning Period. The incremental cost increase from Plan 1 was \$41 million.
- Plan 98 installed three technology types in 2011, including 20 MW of Big Stone Unit II capacity, 20 MW of wind capacity, and 10 MW of combined cycle capacity. The incremental cost increase from Plan 1 was \$58 million.

Section 4

Table 4-5: Expansion Plan Results

Ranking of Potential Expansion Plans

| PV Utility Cost Variance (2006 \$000) | - | 954 | 3,400 | 34,373 | 38,459 | 40,862 | 58,339 |

A sensitivity analysis was performed to investigate whether additional capacity from Big Stone Unit II would be beneficial for the Big Stone II Members. This analysis indicates that at least 30 additional megawatts of capacity from Big Stone Unit II could be cost-effectively added by the Big Stone II Members in 2011. This case is not currently contemplated as a resource expansion alternative because all of the proposed

Big Stone Unit II capacity is already allocated to the Big Stone II partners. However, should additional capacity from the Big Stone Unit II become available, the resource expansion analysis found that additional quantities of the Big Stone Unit II capacity would provide for lower total present value costs for the Big Stone II Members as compared with the lowest-cost base plan described previously. While the reserve margin for the Big Stone II Members would obviously far exceed the 15 percent target under this case, the lower-cost results of this case can be understood when compared to the existing resource alternatives of the Big Stone II Members. The Big Stone II Members rely heavily on market-priced non-firm and economy purchases, and generation from owned, lower-efficiency steam resources, and oil-fired diesel generation to serve their loads. In contrast, savings in energy costs the Big Stone II Members could receive through low-cost energy available from the proposed Big Stone Unit II are projected to offset the incremental fixed and capital costs associated with the additional Big Stone Unit II capacity, resulting in lower total costs for power than what is available from their existing resources.

DSM SCREENING

CMMPA is a project oriented, wholesale provider of power to its members, and as such, CMMPA does not have any direct control over its members regarding the development and implementation of demand-side management programs. In accordance with Minnesota law, the members of CMMPA file reports with the DOC regarding annual efforts made by the utility to implement conservation programs. CMMPA regularly encourages its members to engage in conservation programs and it is currently assisting its members with the development of an integrated SCADA and load management system.

The impacts of DSM programs of the Big Stone II Members are addressed in two ways in the Analysis. First, to the extent that historical levels of DSM (i.e., demand and energy reduction) have occurred and are reflected in the historical demand and energy data reported by the members, then the 2006 Load Forecast captures these effects in the econometric forecast equations presented herein. As such, the forecast load growth contained in this Analysis reflects continued growth in DSM demand and energy reductions in proportion to the projected load growth of the Big Stone II Members.

Even though the load forecast is already likely to contain the forecast effects of DSM load reductions, and, hence, lower levels of need for new capacity, it is still necessary to investigate whether additional amounts of DSM, beyond those already implemented by the members, are warranted. To conduct this evaluation, we relied upon the information provided by the Big Stone II Members in recent Conservation Improvement Program filings. This data, supplemented by additional data provided by the members, indicates that the average program expenditures and energy savings across all DSM programs results in an estimated average costs per kilowatt hour save in the range of \$0.28.

This estimate of average program costs and savings for the Big Stone II Members was combined with other assumptions regarding DSM program costs and impacts, as

Section 4

referenced in Table 4-6, below, to conduct a screening of the average costs and benefits of DSM in the Strategist model. Utilizing Strategist and incorporating the lowest-cost expansion plan described above, it is possible to investigate the existing DSM programs implemented by the Big Stone II Members and the cost-effectiveness of the programs with regard to their ability to avoid projected marginal energy costs and costs of incremental capacity additions that are consistent with the optimum resource expansion plan.

Table 4-6: Average DSM Program Costs and Impacts for the Big Stone II Members

| DSM Program Attributes | Value |
|-------------------------------|--------------|
| Program Implementation Date | 2011 |
| Utility Program Cost | \$0.28/kWh |
| DSM Program Load Factor | 40% |
| DSM Measure Life | 10 yrs |
| DSM Measure Persistence | 100% |
| DSM Program Free-Ridership | 50% |

Utilizing the assumptions presented in Table 4-6 and the avoided utility costs developed from the lowest-cost expansion case, the Strategist model computed a cost to benefit ratio under a Utility Cost Test of 0.57, indicating that the average benefits received by the Big Stone II Members from avoided costs produced from the DSM programs are projected to be 57% of the DSM program costs incurred by the members. Because the existing DSM programs being undertaken by the Big Stone II Members are not shown to be cost effective, it is reasonable to assume that should the members decide or be required to implement additional DSM programs, that additional DSM implementations would likely cost more per unit of benefit received and, therefore, additional DSM implementation would show lower cost to benefit ratios than those computed for the existing programs.

CONCLUSIONS

The resource expansion modeling demonstrates that growth in member and changes in planned capacity results in the need for new capacity additions for the Big Stone II Members in the near future. To meet this need, the Big Stone II Members will need to acquire new capacity resources. Evaluations of available and possible resource alternatives indicate that Big Stone Unit II is a viable, low-cost means for the Big Stone II Members to meet this need. Furthermore, the beneficial results produced by acquiring 30 MW of Big Stone Unit II capacity above the current allocation of the Big Stone II Members underscores the need of the members to obtain low-cost, base-loaded capacity.

APPENDICES

The following appendices are included to provide supplemental information regarding portions of this Resource Expansion Analysis:

Appendix A: Load Forecast Statistical Output

Appendix B: Big Stone II Member Load Forecast Tables and Charts

Appendix C: Historical Weather Data

Appendix D: Big Stone II Member Economic Data

Appendix A

LOAD FORECAST STATISTICAL OUTPUT

Appendix A

Statistical Output

| Member | County | Member Abbreviation | County Abbreviation |
|---------------|-----------------|----------------------------|----------------------------|
| Blue Earth | Faribault | BE | FAR |
| Delano | Wright | DE | WRI |
| Fairfax | Renville | FA | RENV |
| Glencoe | McLeod | GL | MCLE |
| Granite Falls | Yellow Medicine | GR | YELL |
| Janesville | Waseca | JA | WAS |
| Kasson | Dodge | KA | DODG |
| Kenyon | Goodhue | KE | GOOD |
| Mountain Lake | Cottonwood | MO | COTT |
| Sleepy Eye | Brown | SL | BROW |
| Springfield | Brown | SP | BROW |
| Willmar | Kandiyohi | WI | KAND |
| Windom | Cottonwood | WN | COTT |

| Variable Key Codes | |
|---------------------------|--|
| CDD | Cooling Degree Days (Minneapolis - St. Paul Airport) |
| GDP | Gross Domestic Product |
| HDD | Heating Degree Days (Minneapolis - St. Paul Airport) |
| NEL | Net Energy Requirements |
| PY | Total Personal Income |
| RETSAL | Total Retail Sales |
