State of South Dakota

# Interconnection Process for Distributed Generation Systems - Distribution

## Introduction

This document has been prepared to explain the process established in the State of South Dakota, to interconnect a Generation System with Otter Tail Power, the Area Electrical Power System (Area EPS). This document covers the interconnection process for all types of Generation Systems which are rated 10MW's or less of total generation Nameplate Capacity; are planned for interconnection with the Otter Tail Power's Distribution System; are not intended for wholesale transactions and aren't anticipated to affect the transmission system. This document does not discuss the interconnection Technical Requirements, which are covered in the **"State of South Dakota Distributed Generation Interconnection Requirements"** document. This other interconnection requirements document also provides definitions and explanations of the terms utilized within this document. To interconnect a Generation System with the Otter Tail Power, there are several steps that must be followed. This document outlines those steps and the Parties' responsibilities. At any point in the process, if there are questions, please contact the Generation Interconnection Coordinator at Otter Tail Power. Since this document has been developed to provide an interconnection process which covers a very diverse range of Generation Systems, the process appears to be very involved and cumbersome. For many Generation Systems the process is streamlined and provides an easy path for interconnection.

The promulgation of interconnection standards for Generation Systems by the South Dakota Public Utilities Commission (SDPUC) must be done in the context of a reasonable interpretation of the boundary between state and federal jurisdiction. The Federal Energy Regulatory Commission (FERC) has asserted authority in the area; at least as far as interconnection at the transmission level is concerned. Guidelines are found in the Midwest Independent System Transmission Operator's (MISO) FERC Electric Tariff (Third revised volume 1), Attachment R (Small Generator Interconnection Procedures and Agreement).

Through discussions with MISO personnel and as a practical matter, if the Generation System Nameplate Capacity is not greater in size than the minimum expected load on the distribution substation, that is feeding the proposed Generation System, and Generation System's energy is not being sold on the wholesale market, then that installation may be considered as not "affecting" the transmission system and the interconnection may be considered as governed by this process. If the Generation System will be selling energy on the wholesale market or the Generation System's total Nameplate Capacity is greater than the expected distribution substation minimum load, then the Applicant shall contact MISO (Midwest Independent Transmission System Operator) and follow their procedures.

## GENERAL INFORMATION

### A) Definitions

- 1) "Applicant" is defined as the person or entity who is requesting the interconnection of the Generation System with the Otter Tail Power and is responsible for ensuring that the Generation System is designed, operated and maintained in compliance with the Technical Requirements.
- 2) "Area EPS" is defined as an electric power system (EPS) that serves Local EPS's. Note. Typically, an Area EPS has primary access to public rights-of-way, priority crossing of property boundaries, etc. Otter Tail Power's distribution system is an AREA EPS.
- 3) "Area EPS Operator" is the entity who operates the Area EPS, here Otter Tail Power.
- 4) "Dedicated Facilities" is the equipment that is installed due to the interconnection of the Generation System and not required to serve other Otter Tail Power customers.
- 5) "Distribution System" is the Otter Tail Power facilities which are not part of the Otter Tail Power Transmission System or any Generation System.
- 6) "Extended Parallel" means the Generation System is designed to remain connected with the Otter Tail Power for an extended period of time.
- 7) "Generation" is defined as any device producing electrical energy, i.e., rotating generators driven by wind, steam turbines, internal combustion engines, hydraulic turbines, solar, fuel cells, etc.; or any other electric producing device, including energy storage technologies.
- 8) "Generation Interconnection Coordinator" is the person or persons designated by Otter Tail Power to provide a single point of coordination with the Applicant for the generation interconnection process.
- 9) "Generation System" is the interconnected generator(s), controls, relays, switches, breakers, transformers, inverters and associated wiring and cables, up to the Point of Common Coupling.
- 10) "Interconnection Customer" is the party or parties who will own/operate the Generation System and are responsible for meeting the requirements of the agreements and Technical Requirements. This could be the Generation System applicant, installer, owner, designer, or operator.
- 11) "Local EPS" is an electric power system (EPS) contained entirely within a single premises or group of premises
- 12) "Nameplate Capacity" is the total nameplate capacity rating of all the Generation included in the Generation System. For this definition the "standby" and/or maximum rated kW capacity on the nameplate shall be used.

- 13) “Open Transfer” is a method of transferring the local loads from Otter Tail Power to the generator such that the generator and Otter Tail Power are never connected together.
- 14) “Point of Common Coupling” is the point where the Local EPS is connected to Otter Tail Power
- 15) “Quick Closed” is a method of generation transfer which does not parallel or parallels for less than 100msec with Otter Tail Power and has utility grade timers which limit the parallel duration to less than 100 msec (milliseconds) with Otter Tail Power.
- 16) “Technical Requirements” “is the State of South Dakota Distributed Generation Interconnection Requirements”.
- 17) “Transmission System” is the Otter Tail Power owned facilities and controlled or operated by MISO and defined by using guidelines established by FERC, which are not part of the Otter Tail Power Distribution System or any Generation System.

## **B) Dispute Resolution**

The following is the dispute resolution process to be followed for problems that occur with the implementation of this process.

- 1) Each Party agrees to attempt to resolve all disputes arising hereunder promptly, equitably and in a good faith manner.
- 2) In the event a dispute arises under this process, and if it cannot be resolved by the Parties within thirty (30) days after written notice of the dispute to the other Party, the Parties shall submit the dispute to mediation by a mutually acceptable mediator, in a mutually convenient location in the State of South Dakota. The Parties agree to participate in good faith in the mediation for a period of 90 days. If the parties are not successful in resolving their disputes through mediation, then the Parties may refer the dispute for resolution to the South Dakota Public Utilities Commission, which shall maintain continuing jurisdiction over this process

## **C) Otter Tail Power’s Generation Interconnection Coordinator.**

Otter Tail Power shall designate a Generation Interconnection Coordinator(s) and this person or persons shall provide a single point of contact for an Applicant’s questions on this Generation Interconnection process. Otter Tail Power may have several Generation Interconnection Coordinators assigned, due to the geographical size of their electrical service territory or the amount of interconnection applications. This Generation Interconnection Coordinator will typically not be able to directly answer or resolve all of the issues involved in the review and implementation of the interconnection process and standards, but shall be available to provide coordination assistance with the Applicant

## D) Engineering Studies

During the process of design of a Generation System interconnection between a Generation System and Otter Tail Power, there are several studies which many need to be undertaken. On the Local EPS (Customers side of the interconnection) the addition of a Generation System may increase the fault current levels, even if the generation is never interconnected with Otter Tail Power's system. The Interconnection Customer may need to conduct a fault current analysis of the Local EPS in conjunction with adding the Generation System. The addition of the Generation System may also affect Otter Tail Power and special engineering studies may need to be undertaken looking at Otter Tail Power's distribution system with the Generation System included. Appendix D, lists some of the issues that may need to receive further analysis for the Generation System interconnection.

While, it is not a straightforward process to identify which engineering studies are required, we can at least develop screening criteria to identify which Generation Systems may require further analysis. The following is the basic screening criteria to be used for this interconnection process.

- 1) Generation System total Nameplate Capacity does not exceed 5% of the radial circuit expected peak load. The peak load is the total expected load on the radial circuit when the other generators on that same radial circuit are not in operation.
- 2) The aggregate generation's total Nameplate Capacity, including all existing and proposed generation, does not exceed 25% of the radial circuit peak load and that total is also less than the radial circuit minimum load.
- 3) Generation System does not exceed 15% of the Annual Peak Load for the Line Section, which it will interconnect with. A Line Section is defined as that section of the distribution system between two sectionalizing devices in Otter Tail Power's distribution system.
- 4) Generation System does not contribute more than 10% to the distribution circuit's maximum fault current at the point at the nearest interconnection with Otter Tail Power's primary distribution voltage.
- 5) The proposed Generation System total Nameplate Capacity, in aggregate with other generation on the distribution circuit, will not cause any distribution protective devices and equipment to exceed 85 percent of the short circuit interrupting capability.
- 6) If the proposed Generation System is to be interconnected on a single-phase shared secondary, the aggregate generation Nameplate Capacity on the shared secondary, including the proposed generation, does not exceed 20kW.
- 7) Generation System will not be interconnected with a "networked" system

## E) Scoping Meeting

During Step 2 of this process, the Applicant or Otter Tail Power has the option to request a scoping meeting. The purpose of the scoping meeting shall be to discuss the Applicant's interconnection request and review the application filed. This scoping meeting is to be held so that each Party can gain a better understanding of the issues involved with the requested interconnection. Otter Tail Power and Applicant shall bring to the meeting personnel, including system engineers, and other resources as may be reasonably required, to accomplish the purpose of the meeting. The Applicant shall not expect Otter Tail Power to complete the preliminary review of the proposed Generation System at the scoping meeting. If a scoping meeting is requested, Otter Tail Power shall schedule the scoping meeting within the 15 business day review period allowed for in Step 2. Otter Tail Power shall then have an additional 5 days, after the completion of the scoping meeting, to complete the formal response required in Step 2. The Application fee shall cover Otter Tail Power's costs for this scoping meeting. There shall be no additional charges imposed by Otter Tail Power for this initial scoping meeting.

## F) Insurance

- 1) At a minimum, in connection with the Interconnection Customer's performance of its duties and obligations under this Agreement, the Interconnection Customer shall maintain, during the term of the Agreement, general liability insurance, from a qualified insurance agency with a B+ or better rating by "Best" and with a combined single limit of not less than:
  - a) Two million dollars (\$2,000,000) for each occurrence if the Gross Nameplate Rating of the Generation System is greater than 250kW.
  - b) One million dollars (\$1,000,000) for each occurrence if the Gross Nameplate Rating of the Generation System is between 20kW and 250kW.
  - c) Three hundred thousand (\$300,000) for each occurrence if the Gross Nameplate Rating of the Generation System is less than 20kW.
  - d) Such general liability insurance shall include coverage against claims for damages resulting from (i) bodily injury, including wrongful death; and (ii) property damage arising out of the Interconnection Customer's ownership and/or operating of the Generation System under this agreement.
- 2) The general liability insurance required shall, by endorsement to the policy or policies, (a) include Otter Tail Power as an additional insured; (b) contain a severability of interest clause or cross-liability clause; (c) provide that Otter Tail Power shall not by reason of its inclusion as an additional insured incur liability to the insurance carrier for the payment of premium for such insurance; and (d) provide for thirty (30) calendar days' written notice to Otter Tail Power prior to cancellation, termination, alteration, or material change of such insurance.
- 3) If the Generation System is connected to an account receiving residential service from Otter Tail Power and its total generating capacity is smaller than or equal to 20kW, then the endorsements required in Section F.2 shall not apply.

- 4) The Interconnection Customer shall furnish the required insurance certificates and endorsements to Otter Tail Power prior to the initial operation of the Generation System. Thereafter, Otter Tail Power shall have the right to periodically inspect or obtain a copy of the original policy or policies of insurance
- 5) Evidence of the insurance required in Section F.1. shall state that coverage provided is primary and is not excess to or contributing with any insurance or self-insurance maintained by Otter Tail Power.
- 6) If the Interconnection Customer is self-insured with an established record of self-insurance, the Interconnection Customer may comply with the following in lieu of Section F.1 – 5:
  - 7) Interconnection Customer shall provide to Otter Tail Power, at least thirty (30) days prior to the date of initial operation, evidence of an acceptable plan to self-insure to a level of coverage equivalent to that required under section F.1
  - 8) If Interconnection Customer ceases to self-insure to the level required hereunder, or if the Interconnection Customer is unable to provide continuing evidence of it's ability to self-insure, the Interconnection Customer agrees to immediately obtain the coverage required under section F.1.
  - 9) Failure of the Interconnection Customer or Otter Tail Power to enforce the minimum levels of insurance does not relieve the Interconnection Customer from maintaining such levels of insurance or relieve the Interconnection Customer of any liability.

#### **G) Pre-Certification**

The most important part of the process to interconnect generation with Local EPS and Otter Tail Power is safety. One of the key components of ensuring the safety of the public and employees is to ensure that the design and implementation of the elements connected to the electrical power system operate as required. To meet this goal, all of the electrical wiring in a business or residence, is required by the State of South Dakota to be listed by a recognized testing and certification laboratory, for its intended purpose. Typically we see this as "UL" listed. Since Generation Systems have tended to be uniquely designed for each installation they have been designed and approved by Professional Engineers. This process has been set up to be able to deal with these uniquely designed systems. As the number of Generation Systems installed increase, vendors are working towards creating equipment packages which can be tested in the factory and then will only require limited field testing. This will allow us to move towards "plug and play" installations. For this reason, this interconnection process recognizes the efficiency of "pre-certification" of Generation System equipment packages that will help streamline the design and installation process.

An equipment package shall be considered certified for interconnected operation if it has been submitted by a manufacture, tested and listed by a nationally recognized testing and certification laboratory (NRTL) for continuous utility interactive operation in compliance with the applicable codes and standards. Presently generation paralleling equipment that is listed by a nationally recognized testing laboratory as having met the applicable type-testing requirements of UL 1741 and IEEE 929 shall be acceptable for interconnection without additional protection system requirements. An "equipment package" shall include all interface components including switchgear, inverters, or other interface devices and may include an integrated generator or electric source. If the equipment package has been tested and listed as an integrated package which includes a generator or other electric source, it shall not required further design review, testing or additional equipment to meet the certification requirements for interconnection. If the equipment package includes only the interface components (switchgear, inverters, or other interface devices), then the Interconnection Customer shall show that the generator or other electric source being utilized with the equipment package is compatible with the equipment package and consistent with the testing and listing specified for the package. Provided the generator or electric source combined with the equipment package is consistent with the testing ad listing performed by the nationally recognized testing and certification laboratory, no further design review, testing or additional equipment shall be required to meet the certification requirements of this interconnection procedure. A certified equipment package does not include equipment provided by Otter Tail Power.

The use of Pre-Certified equipment does not automatically qualify the Interconnection Customer to be interconnected to Otter Tail Power. An application will still need to be submitted and an interconnection review may still need to be performed, to determine the compatibility of the Generation System with Otter Tail Power.

#### H) **Confidential Information**

Except as otherwise agreed, each Party shall hold in confidence and shall not disclose confidential information, to any person (except employees, officers, representatives and agents, who agree to be bound by this section). Confidential information shall be clearly marked as such on each page or otherwise affirmatively identified. If a court, government agency or entity with the right, power, and authority to do so, requests or requires either Party, by subpoena, oral disposition, interrogatories, requests for production of documents, administrative order, or otherwise, to disclose Confidential Information, that Party shall provide the other Party with prompt notice of such request(s) or requirements(s) so that the other Party may seek an appropriate protective order or waive compliance with the terms of this Agreement. In the absence of a protective order or waiver the Party shall disclose such confidential information which, in the opinion of its counsel, the party is legally compelled to disclose. Each Party will use reasonable efforts to obtain reliable assurance that confidential treatment will be accorded any confidential information so furnished.

#### I) **Non-Warranty.**

Neither by inspection, if any, or non-rejection, nor in any other way, does Otter Tail Power give any warranty, expressed or implied, as to the adequacy, safety, or other characteristics of any structures, equipment, wires, appliances or devices owned, installed or maintained by the Applicant or leased by the Applicant from third parties, including without limitation the Generation System and any structures, equipment, wires, appliances or devices pertinent thereto.

**J) Required Documents**

The chart below lists the documents required for each type and size of Generation System proposed for interconnection.

Find your type of Generation System interconnection, across the top, then follow the chart straight down, to determine what documents are required as part of the interconnection process.

<b>GENERATION INTERCONNECTION DOCUMENT SUMMARY</b>					
Open Transfer	Quick Closed Transfer	Soft Loading Transfer	Extended Parallel Operation		
			QF facility <40kW	Without Sales	With Sales
Interconnection Process (This document)					
State of South Dakota Distributed Generation Interconnection Requirements					
Generation Interconnection Application (Appendix B)					
		Engineering Data Submittal (Appendix C)			
		Interconnection Agreement (Appendix E)			
					MISO / FERC
					PPA

Interconnection Process = “State of South Dakota Interconnection Process for Distributed Generation Systems.” (This document)

State of South Dakota Distributed Generation Interconnection Requirements = “State of South Dakota Distributed Generation Interconnection Requirements”

Generation Interconnection Application = The application form in Appendix B of this document.

Engineering Data Submittal = The Engineering Data Form/Agreement, which is attached as Appendix C of this document.

Interconnection Agreement = “South Dakota State Interconnection Agreement for the Interconnection of Extended Parallel Distributed Generation Systems with Electric Utilities”, which is attached as Appendix E to this document.

MISO = Midwest Independent Transmission System Operator, [www.midwestiso.org](http://www.midwestiso.org)

FERC = Federal Energy Regulatory Commission, [www.ferc.gov](http://www.ferc.gov)

PPA = Power Purchase Agreement

## **Process for Interconnection**

### **Step 1 Application (By Applicant)**

Once a decision has been made by the Applicant, that they would like to interconnect a Generation System with Otter Tail Power, the Applicant shall supply Otter Tail Power with the following information:

- 1) Completed Generation Interconnection Application (Appendix C), including;
  - a) One-line diagram showing;
    - i) Protective relaying.
    - ii) Point of Common Coupling.
  - b) Site plan of the proposed installation.
  - c) Proposed schedule of the installation.
- 2) Payment of the application fee, according to the following sliding scale.

#### **Generation Interconnection Application Fees**

<b>Interconnection Type</b>	<b>≤ 20kW</b>	<b>&gt;20kW &amp; ≤250kW</b>	<b>&gt;250kW &amp; ≤500kW</b>	<b>&gt; 500 kW &amp; ≤1000kW</b>	<b>&gt;1000 kW</b>
<b>Open Transfer</b>	\$0	\$0	\$0	\$100	\$100
<b>Quick Closed</b>	\$0	\$100	\$100	\$250	\$500
<b>Soft Loading</b>	\$100	\$250	\$500	\$500	\$1000
<b>Extended Parallel (Pre Certified System)</b>	\$0	\$250	\$1000	\$1000	\$1500
<b>Other Extended Parallel Systems</b>	\$100	\$500	\$1500	\$1500	\$1500

This application fee is to contribute to Otter Tail Power’s labor costs for administration, review of the design concept and preliminary engineering screening for the proposed Generation System interconnection.

For the Application Fees chart, above;

The size (kW) of the Generation System is the total maximum Nameplate Capacity of the Generation System.

### **Step 2 Preliminary Review (By Otter Tail Power)**

Within 15 business days of receipt of all the information listed in Step 1, Otter Tail Power’s Generation Interconnection Coordinator shall respond to the Applicant with the information listed below. (If the information required in Step 1 is not complete, the Applicant will be notified, within 10 business days of what is missing and no further review will be completed until the missing information is submitted. The 15-day clock will restart with the new submittal)

As part of Step 2 the proposed Generation System will be screened to see if additional Engineering Studies are required. The base screening criteria is listed in the general information section of this document.

- 1) A single point of contact with Otter Tail Power for this project. (Generation Interconnection Coordinator)
- 2) Approval or rejection of the generation interconnection request.
  - a) Rejection – Otter Tail Power shall supply the technical reasons, with supporting information, for rejection of the interconnection Application.
  - b) Approval - An approved Application is valid for 6 months from the date of the approval. Otter Tail Power’s Generation Interconnection Coordinator may extend this time if requested by the Applicant
- 3) If additional specialized engineering studies are required for the proposed interconnection, the following information will be provided to the Applicant. Typical Engineering Studies are outlined in Appendix D. The costs to the Applicant, for these studies shall be not exceed the values shown in the following table for pre-certified equipment.

Generation System Size	Engineering Study Maximum Costs
<20kW	\$0
20kW – 100kW	\$500
100kW – 250kW	\$1000
>250kW or not pre-certified equipment	Actual costs

- a) General scope of the engineering studies required.
  - b) Estimated cost of the engineering studies.
  - c) Estimated duration of the engineering studies.
  - d) Additional information required to allow the completion of the engineering studies.
  - e) Study authorization agreement.
- 4) Comments on the schedule provided.
  - 5) If the rules of MISO (Midwest Independent Transmission System Operator) require that this interconnection request be processed through the MISO process, the Generation Interconnection Coordinator will notify the Applicant that the generation system is not eligible for review through the State of South Dakota process.

**Step 3 Go-No Go Decision for Engineering Studies (By Applicant)**

In this step, the Applicant will decide whether or not to proceed with the required engineering studies for the proposed generation interconnection. If no specialized engineering studies are required by Otter Tail Power, Otter Tail Power and the Applicant will automatically skip this step.

If the Applicant decides NOT to proceed with the engineering studies, the Applicant shall notify the Otter Tail Power’s Generation Interconnection Coordinator, so other generation interconnection requests in the queue are not adversely impacted. Should the Applicant decide to proceed, the Applicant shall provide the following to the Otter Tail Power’s Generation Interconnection Coordinator:

- 1) Payment required by Otter Tail Power for the specialized engineering studies.
- 2) Additional information requested by Otter Tail Power to allow completion of the engineering studies.

#### **Step 4 Engineering Studies (By Otter Tail Power)**

In this step, Otter Tail Power will be completing the specialized engineering studies for the proposed generation interconnection, as outlined in Step 2. These studies should be completed in the time frame provided in step 2, by Otter Tail Power. It is expected that Otter Tail Power shall make all reasonable efforts to complete the Engineering Studies within the time frames shown below. If additional time is required to complete the engineering studies the Generation Interconnection Coordinator shall notify the Applicant and provide the reasons for the time extension. Upon receipt of written notice to proceed, payment of applicable fee, and receipt of all engineering study information requested by Otter Tail Power in step 2, Otter Tail Power shall initiate the engineering studies.

<b>Generation System Size</b>	<b>Engineering Study Completion</b>
<20kW	20 working days
20kW – 250kW	30 working days
250kW – 1MW	40 working days
> 1MW	90 working days

Once it is known by Otter Tail Power that the actual costs for the engineering studies will exceed the estimated amount by more the 25%, then the Applicant shall be notified. Otter Tail Power shall then provide the reason(s) for the studies needing to exceed the original estimated amount and provide an updated estimate of the total cost for the engineering studies. The Applicant shall be given the option of either withdrawing the application, or paying the additional estimated amount to continue with the engineering studies.

#### **Step 5 Study Results and Construction Estimates (By Otter Tail Power)**

Upon completion of the specialized engineering studies, or if none was necessary, the following information will be provided to the Applicant.

- 1) Results of the engineering studies, if needed.
- 2) Monitoring & control requirements for the proposed generation.
- 3) Special protection requirements for the Generation System interconnection.
- 4) Comments on the schedule proposed by the Applicant.
- 5) Distributed Generation distribution constrained credits available
- 6) Interconnection Agreement (if applicable).
- 7) Cost estimate and payment schedule for required Otter Tail Power work, including, but not limited to;
  - a) Labor costs related to the final design review.
  - b) Labor & expense costs for attending meetings
  - c) Required Dedicated Facilities and other Otter Tail Power modification(s).
  - d) Final acceptance testing costs.

## **Step 6 Final Go-No Go Decision (By Applicant)**

In this step, the Applicant shall again have the opportunity to indicate whether or not they want to proceed with the proposed generation interconnection. If the decision is NOT to proceed, the Applicant will notify Otter Tail Power's Generation Interconnection Coordinator, so that other generation interconnections in the queue are not adversely impacted. Should the Applicant decide to proceed, a more detailed design, if not already completed by the Applicant, must be done, and the following information is to be supplied to Otter Tail Power's Generation Interconnection Coordinator:

- 1) Applicable up-front payment required by Otter Tail Power, per Payment Schedule, provided in Step 5. (if applicable)
- 2) Signed Interconnection Agreement (if applicable).
- 3) Final proposed schedule, incorporating Otter Tail Power comments. The schedule of the project should include such milestones as foundations poured, equipment delivery dates, all conduit installed, cutover (energizing of the new switchgear/transfer switch), Otter Tail Power work, relays set and tested, preliminary vendor testing, final Otter Tail Power acceptance testing, and any other major milestones.
- 4) Detailed one-line diagram of the Generation System, including the generator, transfer switch/switchgear, service entrance, lockable and visible disconnect, metering, protection and metering CT's / VT's, protective relaying and generator control system.
- 5) Detailed information on the proposed equipment, including wiring diagrams, models and types.
- 6) Proposed relay settings for all interconnection required relays.
- 7) Detailed site plan of the Generation System.
- 8) Drawing(s) showing the monitoring system (as required per table 5A and section 5 of the "State of South Dakota Distributed Generation Interconnection Requirements". Including a drawing which shows the interface terminal block with Otter Tail Power's monitoring system.
- 9) Proposed testing schedule and initial procedure, including;
  - a) Time of day (after-hours testing required?).
  - b) Days required.
  - c) Testing steps proposed.

## **Step 7 Final Design Review (By Otter Tail Power)**

Within 15 business days of receipt of the information required in Step 6, Otter Tail Power's Generation Interconnection Coordinator will provide the Applicant with an estimated time table for final review. If the information required in Step 6 is not complete, the Applicant will be notified, within 10 business days of what information is missing. No further review may be completed until the missing information is submitted. The 15-business day clock will restart with the new submittal. This final design review shall not take longer than 15 additional business days to complete, for a total of 30 business days.

During this step, Otter Tail Power shall complete the review of the final Generation System design. If the final design has significant changes from the Generation System proposed on the original Application which invalidate the engineering studies or the preliminary engineering screening, the Generation System Interconnection Application request may be rejected by Otter Tail Power and the Applicant may be requested to reapply with the revised design.

Upon completion of this step the Generation Interconnection Coordinator shall supply the following information to the Applicant.

- 1) Requested modifications or corrections of the detailed drawings provided by the Applicant.
- 2) Approval of and agreement with the Project Schedule. (This may need to be interactively discussed between the Parties, during this Step)
- 3) Final review of Distributed Generation Credit amount(s) (where applicable).
- 4) Initial testing procedure review comments. (Additional work on the testing process will occur during Step 8, once the actual equipment is identified)

### **Step 8 Order Equipment and Construction (By Both Parties)**

The following activities shall be completed during this step. For larger installations this step will involve much interaction between the Parties. It is typical for approval drawings to be supplied by the Applicant to Otter Tail Power for review and comments. It is also typical for Otter Tail Power to require review and approval of the drawings that cover the interconnection equipment and interconnection protection system. If Otter Tail Power also requires remote control and/or monitoring, those drawings are also exchanged for review and comment.

By the Applicant's personnel:

- 1) Ordering of Generation System equipment.
- 2) Installing Generation System.
- 3) Submit approval drawings for interconnection equipment and protection systems, as required by Otter Tail Power.
- 4) Provide final relay settings provided to Otter Tail Power.
- 5) Submit Completed and signed Engineering Data Submittal form.
- 6) Submit proof of insurance, as required by the Otter Tail Power tariff(s) or interconnection agreements.
- 7) Submit required State of South Dakota electrical inspection forms ("blue Copy) filed with Otter Tail Power.
- 8) Inspecting and functional testing Generation System components.
- 9) Work with Otter Tail Power personnel and equipment vendor(s) to finalize the installation testing procedure.

By Otter Tail Power personnel:

- 1) Ordering any necessary Otter Tail Power equipment.
- 2) Installing and testing any required equipment.
  - a) Monitoring facilities.
  - b) Dedicated Equipment.
- 3) Assisting Applicant's personnel with interconnection installation coordination issues
- 4) Providing review and input for testing procedures.

### **Step 9 Final Tests (By Otter Tail Power / Applicant)**

(Due to equipment lead times and construction, a significant amount of time may take place between the execution of Step 8 and Step 9.) During this time the final test steps are developed and the construction of the facilities are completed.

Final acceptance testing will commence when all equipment has been installed, all contractor preliminary testing has been accomplished and all Otter Tail Power preliminary testing of the monitoring and dedicated equipment is completed. One to three weeks prior to the start of the acceptance testing of the generation interconnection the Applicant shall provide, a report stating;

- that the Generation System meets all interconnection requirements.
- all contractor preliminary testing has been completed.
- the protective systems are functionally tested and ready.
- and provides a proposed date that the Generation System will be is ready to be energized and acceptance tested.

For non-type certified systems a Professional Electrical Engineer registered in the State of South Dakota is required to provide this formal report.

For smaller systems scheduling of this testing may be more flexible, as less testing time is required than for larger systems.

In many cases, this testing is done after hours to ensure no typical business-hour load is disturbed. If acceptance testing occurs after hours, Otter Tail Power's labor will be billed at overtime wages. During this testing, Otter Tail Power will typically run three different tests. These tests can differ depending on which type of communication / monitoring system(s) Otter Tail Power decides to install at the site.

For, problems created by Otter Tail Power or any Otter Tail Power equipment that arise during testing, Otter Tail Power will fix the problem as soon as reasonably possible. If problems arise during testing which are caused by the Applicant or Applicant's vendor or any vendor supplied or installed equipment, Otter Tail Power will leave the project until the problem is resolved. Having the testing resume will then be subject to Otter Tail Power personnel time and availability.

### **Step 10 (By Otter Tail Power)**

After all Otter Tail Power acceptance testing has been accomplished and all requirements are met, Otter Tail Power shall provide written approval for normal operation of the Generation System interconnection, within 3 business days of successful completion of the acceptance tests..

### **Step 11 (By Applicant)**

Within two (2) months of interconnection, the Applicant shall provide Otter Tail Power with updated drawings and prints showing the Generation System as it were when approved for normal operation by Otter Tail Power. The drawings shall include all changes which were made during construction and the testing process.

## **Attachments:**

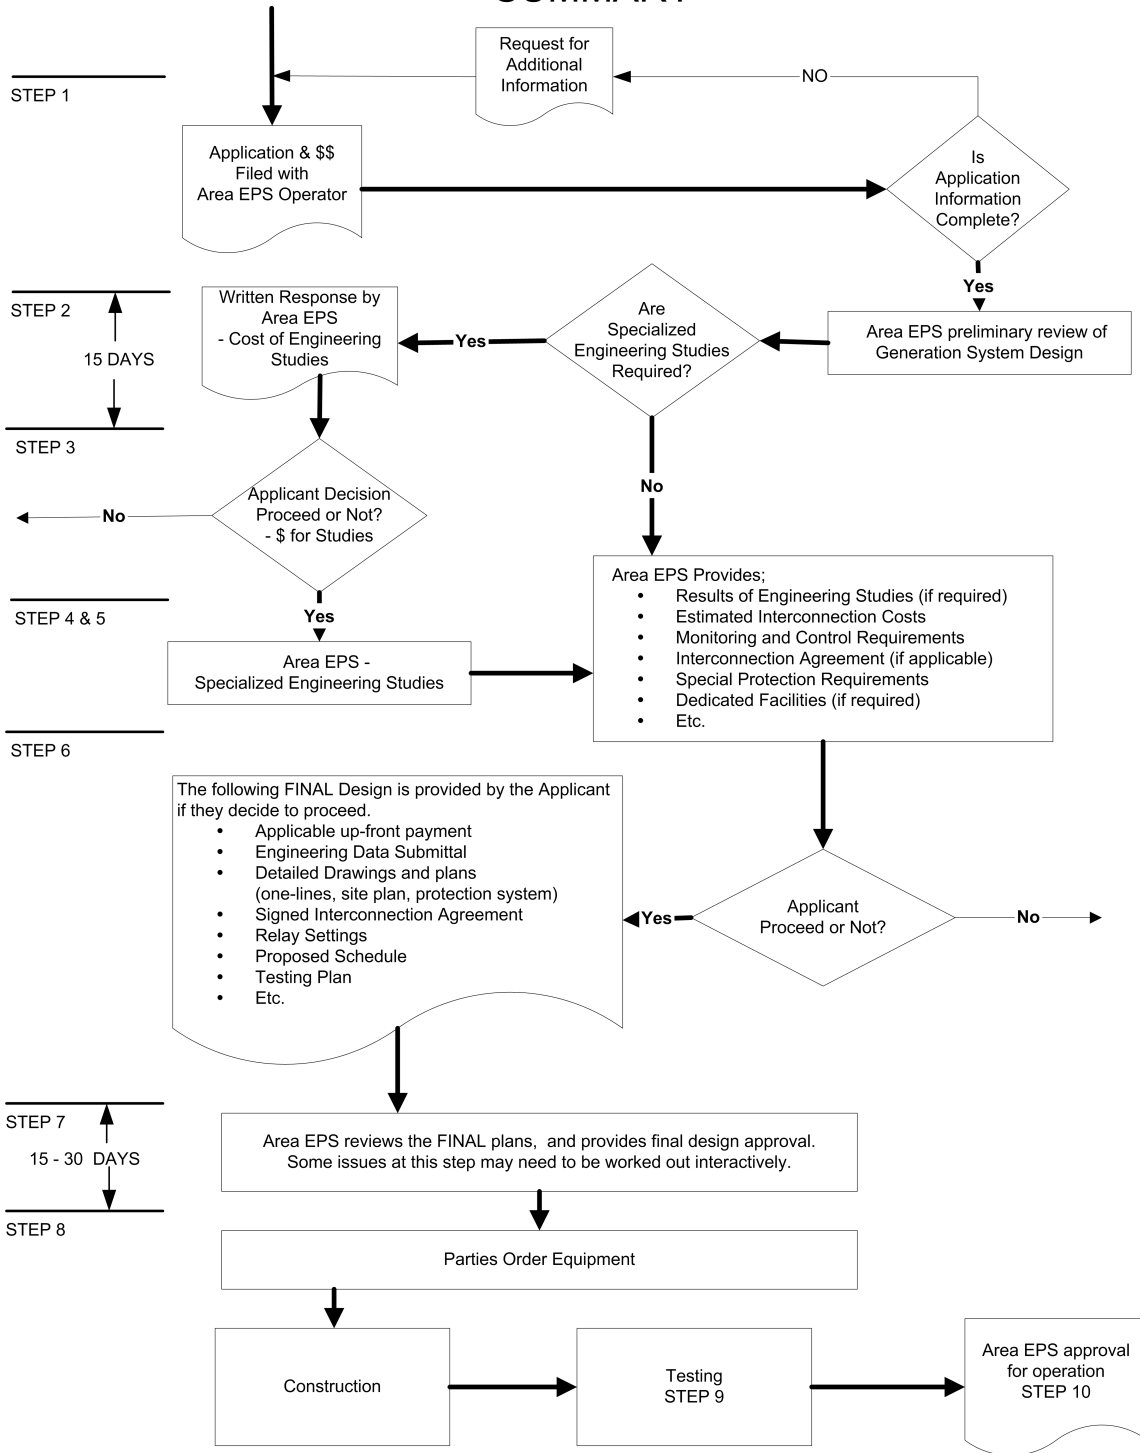

Attached are several documents which may be required for the interconnection process. They are as follows;

- Appendix A: Flow chart showing summary of the interconnection process.
- Appendix B: Generation Interconnection Application Form.
- Appendix C: Engineering Data Submittal Form.
- Appendix D: Engineering Studies: Brief description of the types of possible Engineering Studies that may be required for the review of the Generation System interconnection.
- Appendix E: State of South Dakota Interconnection Agreement for the Interconnection of Extended Paralleled Distributed Generation Systems with Electric Utilities.

# APPENDIX A

## DISTRIBUTED GENERATION INTERCONNECTION PROCESS SUMMARY

## **APPENDIX B**

State of South Dakota

# **Application for interconnection to Otter Tail Power**

# Application for interconnection to Otter Tail Power Page 1

**WHO SHOULD FILE THIS APPLICATION:** Anyone expressing interest to install generation which will interconnect with Otter Tail Power (Local electric utility). This application should be completed and returned to Otter Tail Power Generation Interconnection Coordinator, in order to begin processing the request.

**INFORMATION:** This application is used by Otter Tail Power to perform a preliminary interconnection review. The Applicant shall complete as much of the form as possible. The fields in BOLD are required to be completed to the best of the Applicant's ability. The Applicant will be contacted if additional information is required. The response may take up to 15 business days after receipt of all the required information.

**COST:** A payment to cover the application fee shall be included with this application. The application fee amount is outlined in the "State of South Dakota Interconnection Process for Distributed Generation Systems".

<p><u>Attach a single line diagram showing the switchgear, transformers, and generation facilities. Give a general description of the manner of operation of the generation (cogeneration, closed-transition peak shaving, open-transition peak shaving, emergency power, etc.). Also, does the Applicant intend to sell power and energy or ancillary services and/or wheel power over Otter Tail Power facilities. If there is an intent to sell power and energy, also define the target market.</u></p>		
<b>SIGN OFF AREA:</b>		
<p>With this Application, we are requesting Otter Tail Power to review the proposed Generation System Interconnection. We request that Otter Tail Power identifies the additional equipment and costs involved with the interconnection of this system and to provide a budgetary estimate of those costs. We understand that the estimated costs supplied by Otter Tail Power, will be estimated using the information provided. We also agree that we will supply, as requested, additional information, to allow Otter Tail Power to better review this proposed Generation System interconnection. We have read the "State of South Dakota Distributed Generation Interconnection Requirements" and will design the Generation System and interconnection to meet those requirements.</p>

## **Engineering data submittal**

**For interconnection of distributed generation to Otter Tail Power Company**

**Engineering data submittal**

**For interconnection of distributed generation to Otter Tail Power Company**

**WHO SHOULD FILE THIS SUBMITTAL:** Anyone in the final stages of interconnecting a Generation System with Otter Tail Power. This submittal shall be completed and provided to Otter Tail Power’s Generation Interconnection Coordinator during the design of the Generation System, as established in the “State of South Dakota Interconnection Process for Distributed Generation Systems”.

**INFORMATION:** This submittal is used to document the interconnected Generation System. The Applicant shall complete as much of the form as applicable. The Applicant will be contacted if additional information is required.

## **Engineering data submittal**

For interconnection of distributed generation to Otter Tail Power Company

**MISCELLANEOUS** (Use this area and any additional sheets for applicable notes and comments)

**SIGN OFF AREA**

This Engineering Data Submittal documents the equipment and design of the Generation System. We agree to supply Otter Tail Power with an updated Engineering Data Submittal any time significant changes are made in the equipment used or the design of the proposed Generation System. The Applicant agrees to design, operate and maintain the Generation System within the requirements set forth by the "State of South Dakota Distributed Generation Interconnection Requirements".

Applicant Name (print):

Applicant Signature: \_\_\_\_\_ Date: \_\_\_\_\_

SEND THIS COMPLETED & SIGNED ENGINEERING DATA SUBMITTAL AND ANY ATTACHMENTS TO OTTER TAIL POWER'S GENERATION INTERCONNECTION COORDINATOR

# APPENDIX D

## Engineering Studies

For the engineering studies there are two main parts of the study: 1. Does the distributed generator cause a problem? and 2. What would it cost to make a change to handle the problem? The first question is relatively straightforward to determine as the Otter Tail Power Engineer reviews the proposed installation. The second question typically has multiple alternatives and can turn into an iterative process. This iterative process can become quite large for more complex generation installations. For the Engineer there is no “cook book” solution which can be applied.

For some of the large generation installations and/or the more complex interconnections Otter Tail Power may suggest dividing up the engineering studies into the two parts; identify the scope of the problems and attempt to identify solutions to resolve the problems. By splitting the engineering studies into two steps, it will allow for the Applicant to see the problems identified and to provide the Applicant the ability to remove the request for interconnection if the problems are too large and expensive to resolve. This would then save the additional costs to the Applicant for the more expensive engineering studies; to identify ways to resolve the problem(s).

This appendix provides an overview of some of the main issues that are looked at during the engineering study process. Every interconnection has its unique issues, such as relative strength of the distribution system, ratio of the generation size to the existing area loads, etc. Thus many of the generation interconnections will require further review of one or several of the issues listed.

- Short circuit analysis – the system is studied to make sure that the addition of the generation will not over stress any of the Otter Tail Power equipment and that equipment will still be able to clear during a fault. It is expected that the Applicant will complete their own short circuit analysis on their equipment to ensure that the addition of the generation system does not overstress the Applicant’s electrical equipment.
- Power Flow and Voltage Drop
  - Reviews potential islanding of the generation
  - Will Otter Tail Power Equipment be overloaded
    - Under normal operation?
    - Under contingent operation? With backfeeds?
- Flicker Analysis –
  - Will the operation of the generation cause voltage swings?
    - When it loads up? When it off loads?
  - How will the generation interact with Otter Tail Power’s voltage regulation?
  - Will Otter Tail Power’s capacitor switching affect the generation while on-line?
- Protection Coordination
  - Reclosing issues – this is where the reclosing for the distribution system and transmission system are looked at to see if the Generation System protection can be set up to ensure that it will clear from the distribution system before the feeder is reenergized.
    - Is voltage supervision of reclosing needed?
  - Is transfer-trip required?
  - Do we need to modify the existing protection systems? Existing settings?
  - At which points do we need “out of sync” protection?
  - Is the proposed interconnection protection system sufficient to sense a problem on Otter Tail Power’s distribution system?
  - Are there protection problems created by the step-up transformer?

- Grounding Reviews
  - Does the proposed grounding system for the Generation System meet the requirements of the NESC? “National Electrical Safety Code” published by the Institute of Electrical and Electronics Engineers (IEEE)
  
- System Operation Impact.
  - Are special operating procedures needed with the addition of the generation?
  - Reclosing and out of sync operation of facilities.
  - What limitations need to be placed on the operation of the generation?
  - Operational Var requirements?

## **APPENDIX E**

State of South Dakota  
for the interconnection of extended parallel distributed  
generation systems with Otter Tail Power Company

State of South Dakota  
for the interconnection of extended parallel distributed  
generation systems with Otter Tail Power Company

This Generating System Interconnection Agreement is entered into by and between Otter Tail Corporation, d/b/a Otter Tail Power Company, "Otter Tail", and the Interconnection Customer "\_\_\_\_\_". The Interconnection Customer and Otter Tail are sometimes also referred to in this Agreement jointly as "Parties" or individually as "Party".

In consideration of the mutual promises and obligations stated in this Agreement and its attachments, the Parties agree as follows:

## I. SCOPE AND PURPOSE

- A) Establishment of Point of Common Coupling. This Agreement is intended to provide for the Interconnection Customer to interconnect and operate a Generation System with a total Nameplate Capacity of 10MWs or less in parallel with Otter Tail at the location identified in Exhibit C and shown in the Exhibit A one-line diagram.
- B) This Agreement governs the facilities required to and contains the terms and condition under which the Interconnection Customer may interconnect the Generation System to Otter Tail. This Agreement does not authorize the Interconnection Customer to export power or constitute an agreement to purchased or wheel the Interconnection Customer's power. Other services that the Interconnection Customer may require from Otter Tail, or others, may be covered under separate agreements.
- C) To facilitate the operation of the Generation System, this agreement also allows for the occasional and inadvertent export of energy to Otter Tail. The amount, metering, billing and accounting of such inadvertent energy exporting shall be governed by Exhibit D (Operating Agreement). This Agreement does not constitute an agreement by Otter Tail to purchase or pay for any energy, inadvertently or intentionally exported, unless expressly noted in Exhibit D or under a separately executed power purchase agreement (PPA).
- D) This agreement does not constitute a request for, nor the provision of any transmission delivery service or any local distribution delivery service.
- E) The Technical Requirements for interconnection are covered in a separate Technical Requirements document know as, the "State of South Dakota Distributed Generation Interconnection Requirements", a copy of which as been made available to the Interconnection Customer and incorporated and made part of this Agreement by this reference

## II. DEFINITIONS

- A) "Area EPS" an electric power system (EPS) that serves Local EPS's. Note: Typically, an Area EPS has primary access to public rights-of-way, priority crossing of property boundaries, etc. Otter Tail's distribution system is an Area EPS
- B) "Area EPS Operator" the entity that operates the Area EPS, here Otter Tail.

- C) “Dedicated Facilities” the equipment that is installed due to the interconnection of the Generation System and not required to serve other Otter Tail customers.
- D) “EPS” (Electric Power System)\_facilities that deliver electric power to a load. Note: This may include generation units.
- E) “Extended Parallel” means the Generation System is designed to remain connected with Otter Tail for an extended period of time.
- F) “Generation” any device producing electrical energy, i.e., rotating generators driven by wind, steam turbines, internal combustion engines, hydraulic turbines, solar, fuel cells, etc.; or any other electric producing device, including energy storage technologies.
- G) “Generation Interconnection Coordinator” the person or persons designated by Otter Tail to provide a single point of coordination with the Applicant for the generation interconnection process.
- H) “Generation System” the interconnected generator(s), controls, relays, switches, breakers, transformers, inverters and associated wiring and cables, up to the Point of Common Coupling.
- I) “Interconnection Customer” the party or parties who will own/operate the Generation System and are responsible for meeting the requirements of the agreements and Technical Requirements. This could be the Generation System applicant, installer, owner, designer, or operator.
- J) “Local EPS” an electric power system (EPS) contained entirely within a single premises or group of premises.
- K) “Nameplate Capacity” the total nameplate capacity rating of all the Generation included in the Generation System. For this definition the “standby” and/or maximum rated kW capacity on the nameplate shall be used.
- L) “Point of Common Coupling” the point where the Local EPS is connected to Otter Tail.
- M) “Point of Delivery” the point where the energy changes possession from one party to the other. Typically this will be where the metering is installed but it is not required that the Point of Delivery is the same as where the energy is metered
- N) “Technical Requirements” “State of South Dakota Requirements for Interconnection of Distributed Generation

### **III. DESCRIPTION OF INTERCONNECTION CUSTOMER'S GENERATION SYSTEM**

- A) A description of the Generation System, including a single-line diagram showing the general arrangement of how the Interconnection Customer's Generation System is interconnected with Otter Tail's distribution system, is attached to and made part of this Agreement as Exhibit A. The single-line diagram shows the following;
- 1) Point of Delivery (if applicable)
  - 2) Point of Common Coupling
  - 3) Location of Meter(s)
  - 4) Ownership of the equipment.
  - 5) Generation System total Nameplate Capacity \_\_\_\_\_ kW
  - 6) Scheduled operational (on-line) date for the Generation System.

### **IV. RESPONSIBILITIES OF THE PARTIES**

- A) The Parties shall perform all obligations of this Agreement in accordance with all applicable laws and regulations, operating requirements and good utility practices.
- B) Interconnection Customer shall construct, operate and maintain the Generation System in accordance with the applicable manufacturer's recommended maintenance schedule, the Technical Requirements and in accordance with this Agreement
- C) The Otter Tail shall carry out the construction of the Dedicated Facilities in a good and workmanlike manner, and in accordance with standard design and engineering practices.

### **V. CONSTRUCTION**

The Parties agree to cause their facilities or systems to be constructed in accordance with the laws of the State of South Dakota and to meet or exceed applicable codes and standards provided by the NESC (National Electrical Safety Code), ANSI (American National Standards Institute), IEEE (Institute of Electrical and Electronic Engineers), NEC (National Electrical Code), UL (Underwriter's Laboratory), Technical Requirements and local building codes and other applicable ordinances in effect at the time of the installation of the Generation System.

- A) Charges and payments  
The Interconnection Customer is responsible for the actual costs to interconnect the Generation System with Otter Tail, including, but not limited to any Dedicated Facilities attributable to the addition of the Generation System, Otter Tail labor for installation coordination, installation testing and engineering review of the Generation System and

interconnection design. Estimates of these costs are outlined in Exhibit B. While estimates, for budgeting purposes, have been provided in Exhibit B, the actual costs are still the responsibility of the Interconnection Customer, even if they exceed the estimated amount(s). All costs, for which the Interconnection Customer is responsible for, must be reasonable under the circumstances of the design and construction.

1) Dedicated Facilities

- a) During the term of this Agreement, Otter Tail shall design, construct and install the Dedicated Facilities outlined in Exhibit B. The Interconnection Customer shall be responsible for paying the actual costs of the Dedicated Facilities attributable to the addition of the Generation System.
- b) Once installed, the Dedicated Facilities shall be owned and operated by Otter Tail and all costs associated with the operating and maintenance of the Dedicated Facilities, after the Generation System is operational, shall be the responsibility of the Otter Tail, unless otherwise agreed.
- c) By executing this Agreement, the Interconnection Customer grants permission for Otter Tail to begin construction and to procure the necessary facilities and equipment to complete the installation of the Dedicated Facilities, as outlined in Exhibit B. If for any reason, the Generation System project is canceled or modified, so that any or all of the Dedicated Facilities are not required, the Interconnection Customer shall be responsible for all costs incurred by Otter Tail, including, but not limited to the additional costs to remove and/or complete the installation of the Dedicated Facilities. The Interconnection Customer may, for any reason, cancel the Generation System project, so that any or all of the Dedicated Facilities are not required to be installed. The Interconnection Customer shall provide written notice to Otter Tail of cancellation. Upon receipt of a cancellation notice, Otter Tail shall take reasonable steps to minimize additional costs to the Interconnection Customer, where reasonably possible.

2) Payments

- a) The Interconnection Customer shall provide reasonable adequate assurances of credit, including a letter of credit or personal guaranty of payment and performance from a creditworthy entity acceptable under Otter Tail's credit policy and procedures for the unpaid balance of the estimated amount shown in Exhibit B.
- b) The payment for the costs outlined in Exhibit B, shall be as follows;
  - i. 1/3 of estimated costs, outlined in Exhibit B, shall be due upon execution of this agreement.
  - ii. 1/3 of estimated costs, outlined in Exhibit B, shall be due prior to initial energization of the Generation System, with Otter Tail.
  - iii. Remainder of actual costs, incurred by Otter Tail, shall be due within 30 days from the date the bill is mailed by Otter Tail after project completion.

**VI. DOCUMENTS INCLUDED WITH THIS AGREEMENT.**

A) This agreement includes the following exhibits, which are specifically incorporated herein and made part of this Agreement by this reference: *(if any of these Exhibits are deemed not applicable for this Generation System installation they may be omitted from the final Agreement by Otter Tail.)*

- 1) Exhibit A – Description of Generation System and single-line diagram. This diagram shows all major equipment, including, visual isolation equipment, Point of Common Coupling, Point of Delivery for Generation Systems that intentionally export, ownership of equipment and the location of metering.
- 2) Exhibit B – Estimated installation and testing costs payable by the Interconnection Customer. Included in this listing shall be the description and estimated costs for the required Dedicated Facilities being installed by Otter Tail for the interconnection of the Generation System and a description and estimate for the final acceptance testing work to be done by Otter Tail.
- 3) Exhibit C – Engineering Data Submittal – A standard form that provides the engineering and operating information about the Generation System.
- 4) Exhibit D – Operating Agreement – This provides specific operating information and requirements for this Generation System interconnection. This Exhibit has a separate signature section and may be modified, in writing, from time to time with the agreement of both parties.
- 5) Exhibit E – Maintenance Agreement – This provides specific maintenance requirements for this Generation System interconnection. This Exhibit has a separate signature section and may be modified, in writing, from time to time with the agreement of both parties.

## VII. TERMS AND TERMINATION

- A) This Agreement shall become effective as of the date when both the Interconnection Customer and Otter Tail have both signed this Agreement. The Agreement shall continue in full force and effect until the earliest date that one of the following events occurs:
- 1) The Parties agree in writing to terminate the Agreement; or
  - 2) The Interconnection Customer may terminate this agreement at any time, by written notice to Otter Tail, prior to the completion of the final acceptance testing of the Generation System by Otter Tail. Once the Generation System is operational then VII.A.3 applies. Upon receipt of a cancellation notice, Otter Tail shall take reasonable steps to minimize additional costs to the Interconnection Customer, where reasonably possible.
  - 3) Once the Generation System is operational the Interconnection Customer may terminate this agreement after 30 days written notice to Otter Tail, unless otherwise agreed to within the Exhibit D, Operating Agreement; or
  - 4) The Otter Tail may terminate this agreement after 30 days written notice to the Interconnection Customer if:

- a) The Interconnection Customer fails to interconnect and operate the Generation System per the terms of this Agreement; or
  - b) The Interconnection Customer fails to take all corrective actions specified in Otter Tail's written notice that the Generation System is out of compliance with the terms of this Agreement, within the time frame set forth in such notice, or
  - c) If the Interconnection Customer fails to complete Otter Tail's final acceptance testing of the generation system within 24 months of the date proposed under section III.A.5.
- B) Upon termination of this Agreement the Generation System shall be disconnected from Otter Tail. The termination of this Agreement shall not relieve either Party of its liabilities and obligations, owed or continuing, at the time of the termination.

## VIII. OPERATIONAL ISSUES

Each Party will, at its own cost and expense, operate, maintain, repair and inspect, and shall be fully responsible for, the facilities which it now or hereafter may own, unless otherwise specified.

- A) Technical Standards: The Generation System shall be installed and operated by the Interconnection Customer consistent with the requirements of this Agreement; the Technical Requirements; the applicable requirements located in the National Electrical Code (NEC); the applicable standards published by the American National Standards Institute (ANSI) and the Institute of Electrical and Electronic Engineers (IEEE); and local building and other applicable ordinances in effect at the time of the installation of the Generation System.
- B) Right of Access: At all times, Otter Tail personnel shall have access to the disconnect switch of the Generation System for any reasonable purpose in connection with the performance of the obligations imposed on it by this Agreement, to meet its obligation to operate Otter Tail safely and to provide service to its customers. If necessary for the purposes of this Agreement, the Interconnection Customer shall allow Otter Tail access to Otter Tail's equipment and facilities located on the premises.
- C) Electric Service Supplied: Otter Tail will supply the electrical requirements of the Local EPS that are not supplied by the Generation System. Such electric service shall be supplied, to the Interconnection Customer's Local EPS, under the rate schedules applicable to the Customer's class of service as revised from time to time by Otter Tail.
- D) Operation and Maintenance: The Generation System shall be operated and maintained, by the Interconnection Customer in accordance with the Technical Standards and any additional requirements of Exhibit D and Exhibit E, attached to this document, as amended, in writing, from time to time.
- E) Cooperation and Coordination: Both Otter Tail and the Interconnection Customer shall communicate and coordinate their operations, so that the normal operation of Otter Tail does not unduly effect or interfere with the normal operation of the Generation System and the Generation System does not unduly effect or interfere with the normal operation of Otter Tail. Under abnormal operations of either the Generation System or Otter Tail's system, the responsible Party shall provide reasonably timely communication to the other

Party to allow mitigation of any potentially negative effects of the abnormal operation of their system.

- F) Disconnection of Unit: Otter Tail may disconnect the Generation System as reasonably necessary, for termination of this Agreement; non-compliance with this Agreement; system emergency, imminent danger to the public or Otter Tail personnel; routine maintenance, repairs and modifications to Otter Tail's distribution system. When reasonably possible Otter Tail shall provide prior notice to the Interconnection Customer explaining the reason for the disconnection. If prior notice is not reasonably possible Otter Tail shall after the fact, provide information to the Interconnection Customer as to why the disconnection was required. It is agreed that Otter Tail shall have no liability for any loss of sales or other damages, including all consequential damages for the loss of business opportunity, profits or other losses, regardless of whether such damages were foreseeable, for the disconnection of the Generation System per this Agreement. Otter Tail shall expend reasonable effort to reconnect the Generation System in a timely manner and to work towards mitigating damages and losses to the Interconnection Customer where reasonably possible.
- G) Modifications to the Generation System – When reasonably possible the Interconnection Customer shall notify Otter Tail, in writing, of plans for any modifications to the Generation System interconnection equipment, including all information needed by Otter Tail as part of the review described in this paragraph, at least twenty (20) business days prior to undertaking such modification(s). Modifications to any of the interconnection equipment, including, all interconnection required protective systems, the generation control systems, the transfer switches/breakers, interconnection protection VT's & CT's, and Generation System capacity, shall be included in the notification to Otter Tail. When reasonably possible the Interconnection Customer agrees not to commence installation of any modifications to the Generating System until Otter Tail has approved the modification, in writing, which approval shall not be unreasonably withheld. Otter Tail shall have a minimum of five (5) business days to review and respond to the planned modification. Otter Tail shall not take longer than a maximum of ten (10) business days, to review and respond to the modification after the receipt of the information required to review the modifications. When it is not reasonably possible for the Interconnection Customer to provide prior written notice, the Interconnection Customer shall provide written notice Otter Tail as soon as reasonably possible, after the completion of the modification(s).
- H) Permits and Approvals: The Interconnection Customer shall obtain all environmental and other permits lawfully required by governmental authorities prior to the construction of the Generation System. The Interconnection Customer shall also maintain these applicable permits and compliance with these permits during the term of this Agreement.

## **IX. LIMITATION OF LIABILITY**

- A) Each Party shall at all times indemnify, defend, and save the other Party harmless from any and all damages, losses, claims, including claims and actions relating to injury or death of any person or damage to property, costs and expenses, reasonable attorneys' fees and court costs, arising out of or resulting from the Party's performance of its obligations under this agreement, except to the extent that such damages, losses or claims were caused by the negligence or intentional acts of the other Party.
- B) Each Party's liability to the other Party for failure to perform its obligations under this Agreement, shall be limited to the amount of direct damage actually incurred. In no event shall either Party be liable to the other Party for any punitive, incidental, indirect, special,

or consequential damages of any kind whatsoever, including for loss of business opportunity or profits, regardless of whether such damages were foreseen.

- C) Notwithstanding any other provision in this Agreement, with respect to Otter Tail's provision of electric service to any customer including the Interconnection Customer, Otter Tail's liability to such customer shall be limited as set forth in Otter Tail's tariffs and terms and conditions for electric service, and shall not be affected by the terms of this Agreement. .

## **X. DISPUTE RESOLUTION**

- A) Each Party agrees to attempt to resolve all disputes arising hereunder promptly, equitably and in a good faith manner.
- B) In the event a dispute arises under this Agreement, and if it cannot be resolved by the Parties within thirty (30) days after written notice of the dispute to the other Party, the Parties agree to submit the dispute to mediation by a mutually acceptable mediator, in a mutually convenient location in the State of South Dakota. The Parties agree to participate in good faith in the mediation for a period of 90 days. If the parties are not successful in resolving their disputes through mediation, then the Parties may refer the dispute for resolution to the South Dakota Public Utilities Commission (SDPUC), which shall maintain continuing jurisdiction over this Agreement.

## **XI. INSURANCE**

- A) At a minimum, In connection with the Interconnection Customer's performance of its duties and obligations under this Agreement, the Interconnection Customer shall maintain, during the term of the Agreement, general liability insurance, from a qualified insurance agency with a B+ or better rating by "Best" and with a combined single limit of not less than:
  - 1) Two million dollars (\$2,000,000) for each occurrence if the Gross Nameplate Rating of the Generation System is greater than 250kW.
  - 2) One million dollars (\$1,000,000) for each occurrence if the Gross Nameplate Rating of the Generation System is between 20kW and 250kW.
  - 3) Three hundred thousand (\$300,000) for each occurrence if the Gross Nameplate Rating of the Generation System is equal or less than 20kW.
  - 4) Such general liability insurance shall include coverage against claims for damages resulting from (i) bodily injury, including wrongful death; and (ii) property damage arising out of the Interconnection Customer's ownership and/or operating of the Generation System under this agreement.
- B) The general liability insurance required shall, by endorsement to the policy or policies, (a) include Otter Tail as an additional insured; (b) contain a severability of interest clause or cross-liability clause; (c) provide that Otter Tail shall not by reason of its inclusion as an additional insured incur liability to the insurance carrier for the payment of premium for such insurance; and (d) provide for thirty (30) calendar days' written notice to Otter Tail prior to cancellation, termination, alteration, or material change of such insurance.

- C) If the Generation System is connected to an account receiving residential service from Otter Tail and its total generating capacity is smaller than 40kW, then the endorsements required in Section XI.B shall not apply.
- D) The Interconnection Customer shall furnish the required insurance certificates and endorsements to Otter Tail prior to the initial operation of the Generation System. Thereafter, Otter Tail shall have the right to periodically inspect or obtain a copy of the original policy or policies of insurance
- E) Evidence of the insurance required in Section XI.A. shall state that coverage provided is primary and is not excess to or contributing with any insurance or self-insurance maintained by the Otter Tail.
- F) If the Interconnection Customer is self-insured with an established record of self-insurance, the Interconnection Customer may comply with the following in lieu of Section XI.A – E:
  - 1) Interconnection Customer shall provide to Otter Tail, at least thirty (30) days prior to the date of initial operation, evidence of an acceptable plan to self-insure to a level of coverage equivalent to that required under section XI.A
  - 2) If Interconnection Customer ceases to self-insure to the level required hereunder, or if the Interconnection Customer is unable to provide continuing evidence of its ability to self-insure, the Interconnection Customer agrees to immediately obtain the coverage required under Section XI.A.
- G) Failure of the Interconnection Customer or Otter Tail to enforce the minimum levels of insurance does not relieve the Interconnection Customer from maintaining such levels of insurance or relieve the Interconnection Customer of any liability.
- H) All insurance certificates, statements of self-insurance, endorsements, cancellations, terminations, alterations, and material changes of such insurance shall be issued and submitted to the following:

Otter Tail Power Company  
 Attention: Risk Agent  
 215 South Cascade Street.  
 Fergus Falls, MN 56538-0496

**XII. MISCELLANEOUS**

**A) FORCE MAJEURE**

- 1) An event of Force Majeure means any act of God, act of the public enemy, war, insurrection, riot, fire, storm or flood, explosion, breakage or accident to machinery or equipment, any curtailment, order, regulation or restriction imposed by governmental, military or lawfully established civilian authorities, or any other cause beyond a Party's control. An event of Force Majeure does not include an act of negligence or intentional wrongdoing. Neither Party will be considered in default as to any obligation hereunder if such Party is prevented from fulfilling the obligation due to an event of Force Majeure. However, a Party whose performance under this Agreement

is hindered by an event of Force Majeure shall make all reasonable efforts to perform its obligations hereunder

- 2) Neither Party will be considered in default of any obligation hereunder if such Party is prevented from fulfilling the obligation due to an event of Force Majeure. However, a Party whose performance under this Agreement is hindered by an event of Force Majeure shall make all reasonable efforts to perform its obligations hereunder. .

## B) NOTICES

- 1) Any written notice, demand, or request required or authorized in connection with this Agreement (“Notice”) shall be deemed properly given if delivered in person or sent by first class mail, postage prepaid, to the person specified below:

- a) If to Otter Tail Power

Otter Tail Power Company  
Attention: Generation Interconnection Coordinator  
215 South Cascade Street.  
Fergus Falls, MN 56538-0496

- b) If to Interconnection Customer

\_\_\_\_\_  
Attention: Generation Coordinator

\_\_\_\_\_  
SD, \_\_\_\_\_

- 2) A Party may change its address for notices at any time by providing the other Party written notice of the change, in accordance with this Section.
- 3) The Parties may also designate operating representatives to conduct the daily communications which may be necessary or convenient for the administration of this Agreement. Such designations, including names, addresses, and phone numbers may be communicated or revised by one Party’s notice to the other Party.

## C) ASSIGNMENT

The Interconnection Customer shall not assign its rights nor delegate its duties under this Agreement without Otter Tail’s written consent. Any assignment or delegation the Interconnection Customer makes without Otter Tail’s written consent shall not be valid. Otter Tail shall not unreasonably withhold its consent to the Generating Entities assignment of this Agreement.

## D) NON-WAIVER

None of the provisions of this Agreement shall be considered waived by a Party unless such waiver is given in writing. The failure of a Party to insist in any one or more instances upon strict performance of any of the provisions of this Agreement or to take advantage of any of its rights hereunder shall not be construed as a waiver of any such provisions or the relinquishment of any such rights for the future, but the same shall continue and remain in full force and effect.

**E) GOVERNING LAW AND INCLUSION OF OTTER TAIL'S TARIFFS AND RULES**

- 1) This Agreement shall be interpreted, governed and construed under the laws of the State of South Dakota as if executed and to be performed wholly within the State of South Dakota without giving effect to choice of law provisions that might apply to the law of a different jurisdiction.
- 2) The interconnection and services provided under this Agreement shall at all times be subject to the terms and conditions set forth in the tariff schedules and rules applicable to the electric service provided by Otter Tail, which tariff schedules and rules are hereby incorporated into this Agreement by this reference.
- 3) Notwithstanding any other provisions of this Agreement Otter Tail shall have the right to unilaterally file with the South Dakota PUC, pursuant to the South Dakota PUC's rules and regulations, an application for change in rates, charges, classification, service, tariff or rule or any agreement relating thereto.

**F) AMENDMENT AND MODIFICATION**

This Agreement can only be amended or modified by a writing signed by both Parties.

**G) ENTIRE AGREEMENT**

This Agreement, including all attachments, exhibits, and appendices, constitutes the entire Agreement between the Parties with regard to the interconnection of the Generation System of the Parties at the Point(s) of Common Coupling expressly provided for in this Agreement and supersedes all prior agreements or understandings, whether verbal or written. It is expressly acknowledged that the Parties may have other agreements covering other services not expressly provided for herein, which agreements are unaffected by this Agreement. Each party also represents that in entering into this Agreement, it has not relied on the promise, inducement, representation, warranty, agreement or other statement not set forth in this Agreement or in the incorporated attachments, exhibits and appendices.

**H) CONFIDENTIAL INFORMATION**

Except as otherwise agreed or provided herein, each Party shall hold in confidence and shall not disclose confidential information, to any person (except employees, officers, representatives and agents, who agree to be bound by this section). Confidential information shall be clearly marked as such on each page or otherwise affirmatively identified. If a court, government agency or entity with the right, power, and authority to do so, requests or requires either Party, by subpoena, oral disposition, interrogatories, requests for production of documents, administrative order, or otherwise, to disclose Confidential Information, that Party shall provide the other Party with prompt notice of such request(s) or requirements(s) so that the other Party may seek an appropriate protective order or waive compliance with the terms of this Agreement. In the absence of a protective order or waiver the Party shall disclose such confidential information which, in the opinion of its counsel, the party is legally compelled to disclose. Each Party will use reasonable efforts to obtain reliable assurance that confidential treatment will be accorded any confidential information so furnished

**I) NON-WARRANTY**

Neither by inspection, if any, or non-rejection, nor in any other way, does Otter Tail give any warranty, expressed or implied, as to the adequacy, safety, or other characteristics of any structures, equipment, wires, appliances or devices owned, installed or maintained by the Interconnection Customer or leased by the Interconnection Customer from third parties, including without limitation the Generation System and any structures, equipment, wires, appliances or devices appurtenant thereto.

**J) NO PARTNERSHIP.**

This Agreement shall not be interpreted or construed to create an association, joint venture, agency relationship, or partnership between the Parties or to impose any partnership obligation or partnership liability upon either Party. Neither Party shall have any right, power or authority to enter into any agreement or undertaking for, or act on behalf of, or to act as or be an agent or representative of, or to otherwise bind, the other Party.

**XIII. SIGNATURES**

IN WITNESS WHEREOF, the Parties hereto have caused two originals of this Agreement to be executed by their duly authorized representatives. This Agreement is effective as of the last date set forth below.

## **EXHIBIT A**

### **GENERATION SYSTEM DESCRIPTION AND SINGLE-LINE DIAGRAM**

## EXHIBIT B

### SUMMARY OF OTTER TAIL'S COSTS AND DESCRIPTION OF DEDICATED FACILITIES BEING INSTALLED BY OTTER TAIL FOR THE INTERCONNECTION OF THE GENERATION SYSTEM

This Exhibit shall provide the estimated total costs, that will be the responsibility of the Interconnection Customer. It is assumed that the Initial application has been filed and the engineering studies have been paid for and completed. So those costs are not included on this listing.

What is listed below is a general outline of some of the major areas where costs could occur. Other costs than those listed below may be included by Otter Tail, provided that those costs are a direct result from the request to interconnect the Generation System. The following list is only a guideline and Otter Tail, for each installation will be creating a unique Exhibit B, that is tailored for that specific Generation System interconnection.

- A) Dedicated Facilities (equipment, design and installation labor)
- B) Monitoring & Control System (equipment, design and installation labor)
- C) Design Coordination and Review
- D) Construction Coordination labor costs
- E) Testing (development of tests and physical testing)
- F) Contingency

## **EXHIBIT C**

### **ENGINEERING DATA SUBMITTAL**

Attach a completed Engineering Data Submittal form from Appendix C of “State of South Dakota Interconnection Process for Distributed Generation Systems”.

## EXHIBIT D

### OPERATING AGREEMENT

Each Generation System interconnection will be unique and will require a unique Operating Agreement. The following is a listing of some of the possible areas that will be covered in a operating agreement. The following has not been developed into a standard agreement due to the unique nature of each Generation System. It is envisioned that this Exhibit will be tailored by **Otter Tail** for each Generation System interconnection. It is also intended that this Operating Agreement Exhibit will be reviewed and updated periodically, to allow the operation of the Generation System, to change to meet the needs of both **Otter Tail** and the Interconnection Customer, provided that the change does not negatively affect the other Party. There may also be operating changes required by outside issues, such as changes in FERC and MISO requirements and/or policies which will require this Operating Agreement to be modified.

The following items are provided to show the general types of items which may be included in this Operating Agreement. The items included in the Operating Agreement shall not be limited to the items shown on this list.

- A) Applicable Otter Tail Tariffs – discussion on which tariffs are being applied for this installation and possibly how they will be applied.
- B) Var Requirements – How will the Generation System be required to operate so as to control the power factor of the energy flowing in either direction across the interconnection?
- C) Inadvertent Energy – This Operating Agreement needs to provide the method(s) that will be used to monitor, meter and account for the inadvertent energy used or supplied by the Generation System. Tariffs and operating rules that apply for this Generation System interconnection shall be discussed in this Operating Agreement.
- D) Control Issues - Starting and stopping of the generation, including the remote starting and stopping, if applicable.
- E) Dispatch of Generation Resources - What are the dispatch requirements for the Generation System? Can it only run during Peak Hours? Are there a limited number of hours that it can run? Is it required to have met an availability percentage? This will greatly depend upon the PPA and other requirements. Is the Interconnection Customer required to coordinate outages of the Generation System, with **Otter Tail**?
- F) Outages of Distribution System – How are emergency outages handled? How are other outages scheduled? If the Interconnection Customer requires **Otter Tail** to schedule the outages during after-hours, who pays for **Otter Tail**'s overtime?
- G) Notification / Contacts - Who should be notified? How should they be notified? When should they be notified? For what reasons, should the notification take place?
  - 1) Starting of the Generation

- 2) Dispatching of Generation
  - 3) Notification of failures (both **Otter Tail** and Generation System failures)
- H) Documentation of Operational Settings – How much fuel will the generation System typically have on hand? How long can it run with this fuel capacity? How is the generation system set to operate for a power failure? These may be issues that should be documented in the Operating Agreement. The following are a couple of examples:
- 1) “The Generation System will monitor Otter Tail’s phase voltage and after 2 seconds of any phase voltage below 90% the generation will be started and the load transferred to the generator, if the generation is not already running.”
  - 2) “The Generation System will wait for 30 minutes after it senses the return of Otter Tail’s frequency and voltage, before it will automatically reconnect to **Otter Tail**”
- I) Cost of testing for future failures – If a component of the Generation System fails or needs to be replaced, which effects the interconnection with **Otter Tail**, what is the process for retesting, and for replacement? Who pays for the additional costs of **Otter Tail** to work with the Interconnection Customer to resolve these problems and/or to complete retesting of the modified equipment?
- J) Right of Access: At all times, **Otter Tail** shall have access to the disconnect switch of the Generation System for any reasonable purpose in connection with the performance of the obligations imposed on it by this Agreement, to meet its obligation to operate Otter Tail’s system safely and to provide service to its customers, at all times. If necessary for the purposed of this Agreement, the Interconnection Customer shall allow **Otter Tail** access to **Otter Tail**’s equipment and facilities located on the premises.

IN WITNESS WHEREOF, the Parties hereto have caused two originals of this Agreement to be executed by their duly authorized representatives. This Agreement is effective as of the last date set forth below.

## EXHIBIT E

### MAINTENANCE AGREEMENT

Each Generation System interconnection will be unique and will require a unique Maintenance Agreement. It is envisioned that this Exhibit will be tailored for each Generation System interconnection. It is also intended that this Maintenance Agreement Exhibit will be reviewed and updated periodically, to allow the maintenance of the Generation System be allowed to change to meet the needs of both Otter Tail and the Interconnection Customer, provided that change does not negatively affect the other Party. There may also be changes required by outside issues; such has changes in FERC and MISO requirements and/or policies which will require this agreement to be modified.

A) Routine Maintenance Requirements –

- 1) Who is providing maintenance – Contact information
- 2) Periods of maintenance

B) Modifications to the Generation System - The Interconnection Customer shall notify Otter Tail, in writing of plans for any modifications to the Generation System interconnection equipment at least twenty (20) business days prior to undertaking such modification. Modifications to any of the interconnection equipment, including all required protective systems, the generation control systems, the transfer switches/breakers, VT's & CT's, generating capacity and associated wiring shall be included in the notification to Otter Tail. The Interconnection Customer agrees not to commence installation of any modifications to the Generating System until Otter Tail has approved the modification, in writing. Otter Tail shall have a minimum of five (5) business days and a maximum of ten (10) business days, to review and respond to the modification, after the receipt of the information required to review the modifications.

# Interconnection requirements

## Foreword

Electric distribution system connected generation units span a wide range of sizes and electrical characteristics. Electrical distribution system design varies widely from that required to serve the rural customer to that needed to serve the large commercial customer. With so many variations possible, it becomes complex and difficult to create one interconnection standard that fits all generation interconnection situations.

In establishing a generation interconnection standard there are three main issues that must be addressed; Safety, Economics and Reliability.

The first and most important issue is safety; the safety of the general public and of the employees working on the electrical systems. This standard establishes the technical requirements that must be met to ensure the safety of the general public and of the employees working with Otter Tail Power. Typically designing the interconnection system for the safety of the general public will also provide protection for the interconnected equipment.

The second issue is economics; the interconnection design must be affordable to build. The interconnection standard must be developed so that only those items, that are necessary to meet safety and reliability, are included in the requirements. This standard sets the benchmark for the minimum required equipment. If it is not needed, it will not be required.

The third issue is reliability; the generation system must be designed and interconnected such that the reliability and the service quality for all customers of the electrical power systems are not compromised. This applies to all electrical systems not just Otter Tail Power.

Many generation interconnection standards exist or are in draft form. The IEEE, FERC and many states have been working on generation interconnection standards. There are other standards such as the National Electrical Code (NEC) that, establish requirements for electrical installations. The NEC requirements are in addition to this standard. This standard is designed to document the requirements where the NEC has left the establishment of the standard to "the authority having jurisdiction" or to cover issues which are not covered in other national standards.

This standard covers installations, with an aggregated capacity of 10MW's or less. Many of the requirements in this document do not apply to small, 20 kW or less generation installations. As an aid to the small, distributed generation customer, these small unit interconnection requirements have been extracted from this full standard and are available as a separate, simplified document titled: "Standards for Interconnecting Generation Sources, Rated Less than 20kW with South Dakota Electric Utilities"

# Interconnection requirements

## 1. Introduction

This standard has been developed to document the technical requirements for the interconnection between a Generation System and an area electrical power system "Utility system or Area EPS", here Otter Tail Power. This standard covers 3 phase Generation Systems with an aggregate capacity of 10 MW's or less and single phase Generation Systems with an aggregate capacity of 20 kW or less at the Point of Common Coupling. This standard covers Generation Systems that are interconnected with Otter Tail Power's distribution facilities. This standard does not cover Generation Systems that are directly interconnected with Otter Tail Power's Transmission System, Contact Otter Tail Power for their Transmission System interconnection standards.

While, this standard provides the technical requirements for interconnecting a Generation System with a typical radial distribution system, it is important to note that there are some unique Area EPS, which have special interconnection needs. One example of a unique Area EPS would be one operated as a "networked" system. This standard does not cover the additional special requirements of those systems. The Interconnection Customer must contact the Owner/operator of Otter Tail Power with which the interconnection is intended, to make sure that the Generation System is not proposed to be interconnected with a unique Area EPS. If the planned interconnection is with a unique Area EPS, the Interconnection Customer must obtain the additional requirements for interconnecting with Otter Tail Power.

Otter Tail Power has the right to limit the maximum size of any Generation System or number of Generation Systems that, may want to interconnect, if the Generation System would reduce the reliability to the other customers connected to Otter Tail Power.

This standard only covers the technical requirements and does not cover the interconnection process from the planning of a project through approval and construction. Please read the companion document "State of South Dakota Interconnection Process for Distributed Generation Systems" for the description of the procedure to follow and a generic version of the forms to submit. It is important to also get copies of Otter Tail Power's tariffs concerning generation interconnection which will include rates, costs and standard interconnection agreements. The earlier the Interconnection Customer gets Otter Tail Power involved in the planning and design of the Generation System interconnection the smoother the process will go.

## Interconnection requirements

### A) Definitions

The definitions defined in the "IEEE Standard for Interconnecting Distributed Resources with Electric Power Systems" (1547 Draft Ver. 11) apply to this document as well. The following definitions are in addition to the ones defined in IEEE 1547 , or are repeated from the IEEE 1547 standard.

- i) "Area EPS" an electric power system (EPS) that serves Local EPS's. Note. Typically, an Area EPS has primary access to public rights-of-way, priority crossing of property boundaries, etc. Otter Tail Power's distribution system is an AREA EPS.
- ii) "Generation" any device producing electrical energy, i.e., rotating generators driven by wind, steam turbines, internal combustion engines, hydraulic turbines, solar, fuel cells, etc.; or any other electric producing device, including energy storage technologies.
- iii) "Generation System" the interconnected Distributed Generation(s), controls, relays, switches, breakers, transformers, inverters and associated wiring and cables, up to the Point of Common Coupling.
- iv) "Interconnection Customer" the party or parties who are responsible for meeting the requirements of this standard. This could be the Generation System applicant, installer, designer, owner or operator.
- v) "Local EPS" an electric power system (EPS) contained entirely within a single premises or group of premises.
- vi) "Point of Common Coupling" the point where the Local EPS is connected to Otter Tail Power.
- vii) "Transmission System", the entire generating, transmitting and distributing facilities of an electric company.
- viii) "Type-Certified" Generation paralleling equipment that is listed by an OSHA listed national testing laboratory as having met the applicable type testing requirement of UL 1741. At the time is document was prepared this was the only national standard available for certification of generation transfer switch equipment. This definition does not preclude other forms of type-certification if agreeable to Otter Tail Power.

### B) Interconnection Requirements Goals

This standard defines the minimum technical requirements for the implementation of the electrical interconnection between the Generation System and Otter Tail Power. It does not define the overall requirements for the Generation System. The requirements in this standard are intended to achieve the following:

- i) Ensure the safety of utility personnel and contractors working on the electrical power system.
- ii) Ensure the safety of utility customers and the general public.
- iii) Protect and minimize the possible damage to the electrical power system and other customer's property.
- iv) Ensure proper operation to minimize adverse operating conditions on the electrical power system.

## Interconnection requirements

### C) Protection

The Generation System and Point of Common Coupling shall be designed with proper protective devices to promptly and automatically disconnect the Generation from Otter Tail Power in the event of a fault or other system abnormality. The type of protection required will be determined by:

- i) Size and type of the generating equipment.
- ii) The method of connecting and disconnecting the Generation System from the electrical power system.
- iii) The location of generating equipment on Otter Tail Power.

### D) Otter Tail Power Modifications

Depending upon the match between the Generation System, Otter Tail Power and how the Generation System is operated, certain modifications and/or additions may be required to the existing Otter Tail Power with the addition of the Generation System. To the extent possible, this standard describes the modifications which could be necessary to Otter Tail Power for different types of Generation Systems. For some unique interconnections, additional and/or different protective devices, system modifications and/or additions will be required by Otter Tail Power; In these cases Otter Tail Power will provide the final determination of the required modifications and/or additions. If any special requirements are necessary they will be identified by Otter Tail Power during the application review process.

### E) Generation System Protection

The Interconnection Customer is solely responsible for providing protection for the Generation System. Protection systems required in this standard, are structured to protect Otter Tail Power's electrical power system and the public. The Generation System Protection is not provided for in this standard. Additional protection equipment may be required to ensure proper operation for the Generation System. This is especially true while operating disconnected, from Otter Tail Power. Otter Tail Power does not assume responsibility for protection of the Generation System equipment or of any portion Local EPS.

### F) Electrical Code Compliance

Interconnection Customer shall be responsible for complying with all applicable local, independent, state and federal codes such as building codes, National Electric Code (NEC), National Electrical Safety Code (NESC) and noise and emissions standards. As required by South Dakota State law, Otter Tail Power will require proof of complying with the National Electrical Code before the interconnection is made, through installation approval by an electrical inspector recognized by the South Dakota State Board of Electricity.

The Interconnection Customer's Generation System and installation shall comply with latest revisions of the ANSI/IEEE standards applicable to the installation, especially IEEE 1547; "Standard for Interconnecting Distributed Resources with Electric Power Systems". See the reference section in this document for a partial list of the standards which apply to the generation installations covered by this standard.

# Interconnection requirements

## 3. Types of Interconnections

A) The manner in which the Generation System is connected to and disconnected from Otter Tail Power can vary. Most transfer systems normally operate using one of the following five methods of transferring the load from Otter Tail Power to the Generation System.

B) If a transfer system is installed which has a user accessible selection of several transfer modes, the transfer mode that has the greatest protection requirements will establish the protection requirements for that transfer system.

i) Open Transition (Break-Before-Make) Transfer Switch – With this transfer switch, the load to be supplied from the Distributed Generation is first disconnected from Otter Tail Power and then connected to the Generation. This transfer can be relatively quick, but voltage and frequency excursions are to be expected during transfer. Computer equipment and other sensitive equipment will shut down and reset. The transfer switch typically consists of a standard UL approved transfer switch with mechanical interlocks between the two source contactors that drop Otter Tail Power source before the Distributed Generation is connected to supply the load.

(1) To qualify as an Open Transition switch and the limited protective requirements, mechanical interlocks are required between the two source contacts. This is required to ensure that one of the contacts is always open and the Generation System is never operated in parallel with Otter Tail Power. If the mechanical interlock is not present, the protection requirements are as if the switch is a closed transition switch.

(2) As a practical point of application, this type of transfer switch is typically used for loads less than 500kW. This is due to possible voltage flicker problems created on Otter Tail Power, when the load is removed from or returned to Otter Tail Power source. Depending upon Otter Tail Power's stiffness this level may be larger or smaller than the 500kW level.

(3) Figure 1 at the end of this document provides a typical one-line of this type of installation.

ii) Quick Open Transition (Break-Before-Make) Transfer Switch – The load to be supplied from the Distributed Generation is first disconnected from Otter Tail Power and then connected to the Distributed Generation, similar to the open transition. However, this transition is typically much faster (under 500 ms) than the conventional open transition transfer operation. Voltage and frequency excursions will still occur, but some computer equipment and other sensitive equipment will typically not be affected with a properly designed system. The transfer switch consists of a standard UL approved transfer switch, with mechanical interlocks between the two source contacts that drop Otter Tail Power source before the Distributed Generation is connected to supply the load.

(1) Mechanical interlocks are required between the two source contacts to ensure that one of the contacts is always open. If the mechanical interlock is not present, the protection requirements are as if the switch is a closed transition switch

(2) As a practical point of application this type of transfer switch is typically used for loads less than 500kW. This is due to possible voltage flicker problems created on Otter Tail Power, when the load is removed from or returned to Otter Tail Power source. Depending upon Otter Tail Power's stiffness this level may be larger or smaller than the 500kW level.

(3) Figure 2 at the end of this document provides a typical one-line of this type of installation

## Interconnection requirements

and shows the required protective elements.

iii) Closed Transition (Make-Before-Break) Transfer Switch – The Distributed Generation is synchronized with Otter Tail Power prior to the transfer occurring. The transfer switch then parallels with Otter Tail Power for a short time (100 msec. or less) and then the Generation System and load is disconnect from Otter Tail Power. This transfer is less disruptive than the Quick Open Transition because it allows the Distributed Generation a brief time to pick up the load before the support of Otter Tail Power is lost. With this type of transfer, the load is always being supplied by Otter Tail Power or the Distributed Generation.

- (1) As a practical point of application this type of transfer switch is typically used for loads less than 500kW. This is due to possible voltage flicker problems created on Otter Tail Power, when the load is removed from or returned to Otter Tail Power source. Depending upon Otter Tail Power's stiffness this level may be larger or smaller than the 500kW level.
- (2) Figure 2 at the end of this document provides a typical one-line of this type of installation and shows the required protective elements. The closed transition switch must include a separate parallel time limit relay, which is not part of the generation control PLC and trips the generation from the system for a failure of the transfer switch and/or the transfer switch controls.

### iv) Soft Loading Transfer Switch

(1) With Limited Parallel Operation – The Distributed Generation is paralleled with Otter Tail Power for a limited amount of time (generally less than 1-2 minutes) to gradually transfer the load from Otter Tail Power to the Generation System. This minimizes the voltage and frequency problems, by softly loading and unloading the Generation System.

- (a) The maximum parallel operation shall be controlled, via a parallel timing limit relay (62PL). This parallel time limit relay shall be a separate relay and not part of the generation control PLC.
- (b) Protective Relaying is required as described in section 6.
- (c) Figure 3 at the end of this document provide typical one-line diagrams of this type of installation and show the required protective elements.

(2) With Extended Parallel Operation – The Generation System is paralleled with Otter Tail Power in continuous operation. Special design, coordination and agreements are required before any extended parallel operation will be permitted. Otter Tail Power interconnection study will identify the issues involved.

- (a) Any anticipated use in the extended parallel mode requires special agreements and special protection coordination.
- (b) Protective Relaying is required as described in section 6.
- (c) Figure 4 at the end of this document provides a typical one-line for this type of interconnection. It must be emphasized that this is a typical installations only and final installations may vary from the examples shown due to transformer connections, breaker configuration, etc.

### v) Inverter Connection

This is a continuous parallel connection with the system. Small Generation Systems may utilize inverters to interface to Otter Tail Power. Solar, wind and fuel cells are some examples of Generation which typically use inverters to connect to Otter Tail Power. The design of such inverters shall either contain all necessary protection to prevent unintentional islanding, or the

## Interconnection requirements

Interconnection Customer shall install conventional protection to affect the same protection. All required protective elements for a soft-loading transfer switch apply to an inverter connection. Figure 5 at the end of this document, shows a typical inverter interconnection.

- (1) Inverter Certification – Prior to installation, the inverter shall be Type-Certified for interconnection to the electrical power system. The certification will confirm its anti-islanding protection and power quality related levels at the Point of Common Coupling. Also, utility compatibility, electric shock hazard and fire safety are approved through UL listing of the model. Once this Type Certification is completed for that specific model, additional design review of the inverter should not be necessary by Otter Tail Power.
- (2) For three-phase operation, the inverter control must also be able to detect and separate for the loss of one phase. Larger inverters will still require custom protection settings, which must be calculated and designed to be compatible with the specific Area EPS (i.e. Otter Tail Power) being interconnected with.
- (3) A visible disconnect is required for safely isolating the Distributed Generation when connecting with an inverter. The inverter shall not be used as a safety isolation device.
- (4) When banks of inverter systems are installed at one location, a design review by Otter Tail Power must be performed to determine any additional protection systems, metering or other needs. The issues will be identified by Otter Tail Power during the interconnection study process

# Interconnection requirements

## 4. Interconnection Issues and Technical Requirements

A) General Requirements - The following requirements apply to all interconnected generating equipment. Otter Tail Power shall be the source side and the customer's system shall be the load side in the following interconnection requirements.

i) Visible Disconnect - A disconnecting device shall be installed to electrically isolate Otter Tail Power from the Generation System. The only exception for the installation of a visible disconnect is if the generation is interconnected via a mechanically interlocked open transfer switch and installed per the NEC (702.6) "so as to prevent the inadvertent interconnection of normal and alternate sources of supply in any operation of the transfer equipment."

The visible disconnect shall provide a visible air gap between Interconnection Customer's Generation and Otter Tail Power in order to establish the safety isolation required for work on Otter Tail Power's distribution system. This disconnecting device shall be readily accessible 24 hours per day by Otter Tail Power field personnel and shall be capable of padlocking by Otter Tail Power field personnel. The disconnecting device shall be lockable in the open position.

The visible disconnect shall be a UL approved or National Electrical Manufacturer's Association approved, manual safety disconnect switch of adequate ampere capacity. The visible disconnect shall not open the neutral when the switch is open. A draw-out type circuit breaker can be used as a visual open.

The visible disconnect shall be labeled, as required by Otter Tail Power to inform Otter Tail Power field personnel.

ii) Energization of Equipment by Generation System – The Generation System shall not energize a de-energized Otter Tail Power's distribution system. The Interconnection Customer shall install the necessary padlocking (lockable) devices on equipment to prevent the energization of a de-energized electrical power system. Lock out relays shall automatically block the closing of breakers or transfer switches on to a de-energized Otter Tail Power's distribution system.

iii) Power Factor - The power factor of the Generation System and connected load shall be as follows;

- (1) Inverter Based interconnections – shall operate at a power factor of no less than 90% at the inverter terminals.
- (2) Limited Parallel Generation Systems, such as closed transfer or soft-loading transfer systems shall operate at a power factor of no less than 90%, during the period when the Generation System is parallel with Otter Tail Power, as measured at the Point of Common Coupling.
- (3) Extended Parallel Generation Systems shall be designed to be capable of operating between 90% lagging and 95% leading. These Generation Systems shall normally operate near unity power factor (+/-98%) or as mutually agreed between Otter Tail Power and the Interconnection Customer.

iv) Grounding Issues

- (1) Grounding of sufficient size to handle the maximum available ground fault current shall be designed and installed to limit step and touch potentials to safe levels as set forth in "IEEE Guide for Safety in AC Substation Grounding", ANSI/IEEE Standard 80.
- (2) It is the responsibility of the Interconnection Customer to provide the required grounding

## Interconnection requirements

for the Generation System. A good standard for this is the IEEE Std. 142-1991 "Grounding of Industrial and Commercial Power Systems"

(3) All electrical equipment shall be grounded in accordance with local, state and federal electrical and safety codes and applicable standards

v) Sales to Otter Tail Power or other parties – Transportation of energy on the Transmission system is regulated by the area reliability council and FERC. Those contractual requirements are not included in this standard. Otter Tail Power will provide these additional contractual requirements during the interconnection approval process.

B) For Inverter based, closed transfer and soft loading interconnections - The following additional requirements apply:

i) Fault and Line Clearing - The Generation System shall be removed from Otter Tail Power for any faults, or outages occurring on the electrical circuit serving the Generation System

ii) Operating Limits in order to minimize objectionable and adverse operating conditions on the electric service provided to other customers connected to Otter Tail Power, the Generation System shall meet the Voltage, Frequency, Harmonic and Flicker operating criteria as defined in the IEEE 1547 standard during periods when the Generation System is operated in parallel with Otter Tail Power.

If the Generation System creates voltage changes greater than 4% on Otter Tail Power, it is the responsibility of the Interconnection Customer to correct these voltage sag/swell problems caused by the operation of the Generation System. If the operation of the interconnected Generation System causes flicker, which causes problems for others customer's interconnected to Otter Tail Power, the Interconnection Customer is responsible for correcting the problem.

iii) Flicker - The operation of Generation System is not allowed to produce excessive flicker to adjacent customers. See the IEEE 1547 standard for a more complete discussion on this requirement.

The stiffer Otter Tail Power, the larger a block load change that it will be able to handle. For any of the transfer systems Otter Tail Power voltage shall not drop or rise greater than 4% when the load is added or removed from Otter Tail Power. It is important to note, that if another interconnected customer complains about the voltage change caused by the Generation System, even if the voltage change is below the 4% level, it is the Interconnection Customer's responsibility to correct or pay for correcting the problem. Utility experience has shown that customers have seldom objected to instantaneous voltage changes of less than 2% on Otter Tail Power's distribution system, so most Otter Tail Power operators use a 2% design criteria

iv) Interference - The Interconnection Customer shall disconnect the Distributed Generation from Otter Tail Power if the Distributed Generation causes radio, television or electrical service interference to other customers, via the EPS or interference with the operation of Otter Tail Power's distribution system. The Interconnection Customer shall either effect repairs to the Generation System or reimburse Otter Tail Power Operator for the cost of any required Otter Tail Power modifications due to the interference.

## Interconnection requirements

### v) Synchronization of Customer Generation-

- (1) An automatic synchronizer with synch-check relaying is required for unattended automatic quick open transition, closed transition or soft loading transfer systems.
- (2) To prevent unnecessary voltage fluctuations on Otter Tail Power, it is required that the synchronizing equipment be capable of closing the Distributed Generation into Otter Tail Power within the limits defined in IEEE 1547 . Actual settings shall be determined by the Registered Professional Engineer establishing the protective settings for the installation.
- (3) Unintended Islanding – Under certain conditions with extended parallel operation, it would be possible for a part of Otter Tail Power to be disconnected from the rest of Otter Tail Power and have the Generation System continue to operate and provide power to a portion of the isolated circuit. This condition is called "islanding". It is not possible to successfully reconnect the energized isolated circuit to the rest of Otter Tail Power since there are no synchronizing controls associated with all of the possible locations of disconnection. Therefore, it is a requirement that the Generation System be automatically disconnected from Otter Tail Power immediately by protective relays for any condition that would cause Otter Tail Power to be de-energized. The Generation System must either isolate with the customer's load or trip. The Generation System must also be blocked from closing back into Otter Tail Power until Otter Tail Power is reenergized and Otter Tail Power voltage is within Range B of ANSI C84.1 Table 1 for a minimum of 1 minute. Depending upon the size of the Generation System it may be necessary to install direct transfer trip equipment from Otter Tail Power source(s) to remotely trip the generation interconnection to prevent islanding for certain conditions

### vi) Disconnection – Otter Tail Power operator may refuse to connect or may disconnect a Generation System from Otter Tail Power under the following conditions:

- (1) Lack of approved Standard Application Form and Standard Interconnection Agreement.
- (2) Termination of interconnection by mutual agreement.
- (3) Non-Compliance with the technical or contractual requirements.
- (4) System Emergency or for imminent danger to the public or Otter Tail Power personnel (Safety).
- (5) Routine maintenance, repairs and modifications to Otter Tail Power. Otter Tail Power operator shall coordinate planned outages with the Interconnection Customer to the extent possible.

## Interconnection requirements

### 5. Generation Metering, Monitoring and Control

Metering, Monitoring and Control – Depending upon the method of interconnection and the size of the Generation System, there are different metering, monitoring and control requirements Table 5A is a table summarizing the metering, monitoring and control requirements..

Due to the variation in Generation Systems and Otter Tail Power operational needs, the requirements for metering, monitoring and control listed in this document are the expected maximum requirements that Otter Tail Power will apply to the Generation System. It is important to note that for some Generation System installations Otter Tail Power may waive some of the requirements of this section if they are not needed. An example of this is with rural or low capacity feeders which require more monitoring than larger capacity, typically urban feeders.

Another factor which will effect the metering, monitoring and control requirements will be the tariff under which the Interconnection Customer is supplied by Otter Tail Power. Table 5A has been written to cover most application, but some Otter Tail Power tariffs may have greater or less metering, monitoring and control requirements than, as shown in Table 5A. .

## Interconnection requirements

<b>TABLE 5A Metering, Monitoring and Control Requirements</b>			
<b>Generation System Capacity at Point of Common Coupling</b>	<b>Metering</b>	<b>Generation Remote Monitoring</b>	<b>Generation Remote Control</b>
<b>&lt; 20 kW with all sales to Otter Tail Power</b>	Bi-Directional metering at the point of common coupling	None Required	None Required
<b>20 – 250kW with limited parallel</b>	Detented Otter Tail Power Metering at the Point of Common Coupling	None Required	None Required
<b>20 – 250kW with extended parallel</b>	Recording metering on the Generation System and a separate recording meter on the load	Interconnection Customer supplied direct dial phone line. Otter Tail Power to supply it's own monitoring equipment	None Required
<b>250 – 1000 kW with limited parallel</b>	Detented Otter Tail Power Metering at the Point of Common Coupling	Interconnection Customer supplied direct dial phone line and monitoring points available. See B (i)	None Required
<b>250 – 1000 kW With extended parallel operation</b>	Recording metering on the Generation System and a separate recording meter on the load.	Required Otter Tail Power remote monitoring system See B (i)	None Required
<b>&gt;1000 kW With limited parallel Operation</b>	Detented Otter Tail Power Metering at the Point of Common Coupling	Required Otter Tail Power SCADA monitoring system. See B (i)	None required
<b>&gt;1000 kW With extended parallel operation</b>	Recording metering on the Generation System and a separate recording meter on the load.	Required Otter Tail Power SCADA monitoring system See B (i)	Direct Control via SCADA by Otter Tail Power of interface breaker.

"Detented" = A meter which is detented will record power flow in only one direction.

## Interconnection requirements

### A) Metering

- i) As shown in Table 5A the requirements for metering will depend up on the type of generation and the type of interconnection. For most installations, the requirement is a single point of metering at the Point of Common Coupling. Otter Tail Power Operator will install a special meter that is capable of measuring and recording energy flow in both directions, for three phase installations or two detented meters wired in series, for single phase installations.. A dedicated - direct dial phone line may be required to be supplied to the meter for Otter Tail Power's use to read the metering. Some monitoring may be done through the meter and the dedicated – direct dial phone line, so in many installations the remote monitoring and the meter reading can be done using the same dial-up phone line.
- ii) Depending upon which tariff the Generation System and/or customer's load is being supplied under, additional metering requirements may result. Contact Otter Tail Power for tariff requirements. In some cases, the direct dial-phone line requirement may be waived by Otter Tail Power for smaller Generation Systems.
- iii) All Otter Tail Power's revenue meters shall be supplied, owned and maintained by Otter Tail Power. All voltage transformers (VT) and current transformers (CT), used for revenue metering shall be approved and/or supplied by Otter Tail Power. Otter Tail Power's standard practices for instrument transformer location and wiring shall be followed for the revenue metering.
- iv) For Generation Systems that sell power and are greater than 20 kW in size, separate metering of the generation and of the load is required. A single meter recording the power flow at the Point of Common Coupling for both the Generation and the load, is not allowed by the rules under which the area transmission system is operated. Otter Tail Power is required to report to the regional reliability council (MAPP) the total peak load requirements and is also required to own or have contracted for, accredited generation capacity of 115% of the experienced peak load level for each month of the year. Failure to meet this requirement results in a large monetary penalty for Otter Tail Power operator.

B) Monitoring (SCADA) is required as shown in table 5A. The need for monitoring is based on the need of the system control center to have the information necessary for the reliable operation of Otter Tail Power's. This remote monitoring is especially important during periods of abnormal and emergency operation.

The difference in Table 5A between remote monitoring and SCADA is that SCADA typically is a system that is in continuous communication with a central computer and provides updated values and status, to Otter Tail Power operator, within several seconds of the changes in the field. Remote monitoring on the other hand will tend to provide updated values and status within minutes of the change in state of the field. Remote monitoring is typically less expensive to install and operate.

- i) Where Remote Monitoring or SCADA is required, as shown in Table 5A, the following monitored and control points are required:
  - (1) Real and reactive power flow for each Generation System (kW and kVAR). Only required if separate metering of the Generation and the load is required, otherwise #4 monitored at the point of Common Coupling will meet the requirements.
  - (2) Phase voltage representative of Otter Tail Power's service to the facility.
  - (3) Status (open/close) of Distributed Generation and interconnection breaker(s) or if transfer switch is used, status of transfer switch(s).

## Interconnection requirements

(4) Customer load from Otter Tail Power service (kW and kVAR).

(5) Control of interconnection breaker - if required by Otter Tail Power operator.

When telemetry is required, the Interconnection Customer must provide the communications medium to Otter Tail Power's Control Center. This could be radio, dedicated phone circuit or other form of communication. If a telephone circuit is used, the Interconnection Customer must also provide the telephone circuit protection. The Interconnection Customer shall coordinate the RTU (remote terminal unit) addition with Otter Tail Power. Otter Tail Power may require a specific RTU and/or protocol to match their SCADA or remote monitoring system.

# Interconnection requirements

## 6. Protective Devices and Systems

A) Protective devices required to permit safe and proper operation of Otter Tail Power while interconnected with customer's Generation System are shown in the figures at the end of this document. In general, an increased degree of protection is required for increased Distributed Generation size. This is due to the greater magnitude of short circuit currents and the potential impact to system stability from these installations. Medium and large installations require more sensitive and faster protection to minimize damage and ensure safety.

If a transfer system is installed which has a user accessible selection of several transfer modes, the transfer mode which has the greatest protection requirements will establish the protection requirements for that transfer system.

The Interconnection Customer shall provide protective devices and systems to detect the Voltage, Frequency, Harmonic and Flicker levels as defined in the IEEE 1547 standard during periods when the Generation System is operated in parallel with Otter Tail Power. The Interconnection Customer shall be responsible for the purchase, installation, and maintenance of these devices. Discussion on the requirements for these protective devices and systems follows:

### i) Relay settings

- (1) If the Generation System is utilizing a Type-Certified system, such as a UL listed inverter a Professional Electrical Engineer is not required to review and approve the design of the interconnecting system. If the Generation System interconnecting device is not Type-Certified or if the Type-Certified Generation System interconnecting device has additional design modifications made, the Generation System control, the protective system, and the interconnecting device(s) shall be reviewed and approved by a Professional Electrical Engineer, registered in the State of South Dakota.
- (2) A copy of the proposed protective relay settings shall be supplied to Otter Tail Power operator for review and approval, to ensure proper coordination between the generation system and Otter Tail Power.

### ii) Relays

- (1) All equipment providing relaying functions shall meet or exceed ANSI/IEEE Standards for protective relays, i.e., C37.90, C37.90.1 and C37.90.2.
- (2) Required relays that are not "draw-out" cased relays shall have test plugs or test switches installed to permit field testing and maintenance of the relay without unwiring or disassembling the equipment. Inverter based protection is excluded from this requirement for Generation Systems <20 kW at the Point of Common Coupling.
- (3) Three phase interconnections shall utilize three phase power relays, which monitor all three phases of voltage and current, unless so noted in the appendix one-lines.
- (4) All relays shall be equipped with setting limit ranges at least as wide as specified in IEEE 1547, and meet other requirements as specified in Otter Tail Power interconnect study. Setting limit ranges are not to be confused with the actual relay settings required for the proper operation of the installation. At a minimum, all protective systems shall meet the requirements established in IEEE 1547.
  - (a) Over-current relays (IEEE Device 50/51 or 50/51V) shall operate to trip the protecting

## Interconnection requirements

breaker at a level to ensure protection of the equipment and at a speed to allow proper coordination with other protective devices. For example, the over-current relay monitoring the interconnection breaker shall operate fast enough for a fault on the customer's equipment, so that no protective devices will operate on Otter Tail Power. 51V is a voltage restrained or controlled over-current relay and may be required to provide proper coordination with Otter Tail Power.

- (b) Over-voltage relays (IEEE Device 59) shall operate to trip the Distributed Generation per the requirements of IEEE 1547 .
- (c) Under-voltage relays (IEEE Device 27) shall operate to trip the Distributed Generation per the requirements of IEEE 1547
- (d) Over-frequency relays (IEEE Device 81O) shall operate to trip the Distributed Generation off-line per the requirements of IEEE 1547 .
- (e) Under-frequency relay (IEEE Device 81U) shall operate to trip the Distributed Generation off-line per the requirements of IEEE 1547 . For Generation Systems with an aggregate capacity greater than 30kW, the Distributed Generation shall trip off-line when the frequency drops below 57.0-59.8 Hz. typically this is set at 59.5 Hz, with a trip time of 0.16 seconds, but coordination with Otter Tail Power is required for this setting.

Otter Tail Power will provide the reference frequency of 60 Hz. The Distributed Generation control system must be used to match this reference. The protective relaying in the interconnection system will be expected to maintain the frequency of the output of the Generation.

- (f) Reverse power relays (IEEE Device 32) (power flowing from the Generation System to Otter Tail Power) shall operate to trip the Distributed Generation off-line for a power flow to the system with a maximum time delay of 2.0 seconds.
- (g) Lockout Relay (IEEE Device 86) is a mechanically locking device which is wired into the close circuit of a breaker or switch and when tripped will prevent any close signal from closing that device. This relay requires that a person manually resets the lockout relay before that device can be reclosed. These relays are used to ensure that a deenergized system is not reenergized by automatic control action, and prevents a failed control from auto-reclosing an open breaker or switch.
- (h) Transfer Trip – All Generation Systems are required to disconnect from Otter Tail Power when Otter Tail Power is disconnected from its source, to avoid unintentional islanding. With larger Generation Systems, which remain in parallel with Otter Tail Power, a transfer trip system may be required to sense the loss of Otter Tail Power source. When Otter Tail Power source is lost, a signal is sent to the Generation System to separate the Generation from Otter Tail Power. The size of the Generation System vs the capacity and minimum loading on the feeder will dictate the need for transfer trip installation. Otter Tail Power interconnection study will identify the specific requirements.

If multiple Otter Tail Power sources are available or multiple points of sectionalizing on Otter Tail Power, then more than one transfer trip system may be required. Otter Tail Power interconnection study will identify the specific requirements. For some installations the alternate Otter Tail Power source(s) may not be utilized except in rare occasions. If this is the situation, the Interconnection Customer may elect to have the Generation System locked out when the alternate source(s) are utilized, if agreeable to Otter Tail Power operator.

## Interconnection requirements

- (i) Parallel limit timing relay (IEEE Device 62PL) set at a maximum of 120 seconds for soft transfer installations and set no longer than 100ms for quick transfer installations, shall trip the Distributed Generation circuit breaker on limited parallel interconnection systems. Power for the 62 PL relay must be independent of the transfer switch control power. The 62PL timing must be an independent device from the transfer control and shall not be part of the generation PLC or other control system.

TABLE 6A SUMMARY OF RELAYING REQUIREMENTS								
Type of Interconnection	Over-current (50/51)	Voltage (27/59)	Frequency (81 0/U)	Reverse Power (32)	Lockout (86)	Parallel Limit Timer	Sync-Check (25)	Transfer Trip
Open Transition Mechanically Interlocked (Fig. 1)	—	—	—	—	—	—	—	—
Quick Open Transition Mechanically Interlocked (Fig. 2)	—	—	—	—	Yes	Yes	Yes	—
Closed Transition (Fig. 2)	—	—	—	—	Yes	Yes	Yes	—
Soft Loading Limited Parallel Operation (Fig. 3)	Yes	Yes	Yes	Yes	Yes	Yes	Yes	—
Soft Loading Extended Parallel < 250 kW (Fig. 4)	Yes	Yes	Yes	—	Yes	—	Yes	—
Soft Loading Extended Parallel >250kW (Fig.4)	Yes	Yes	Yes	—	Yes	—	Yes	Yes
Inverter Connection (Fig. 5)								
< 20 kW	Yes	Yes	Yes	—	Yes	—	—	—
20 kW – 250kW	Yes	Yes	Yes	—	Yes	—	—	—
> 250 kW	Yes	Yes	Yes	—	Yes	—	—	Yes

# Interconnection requirements

## 7. Agreements

A) Interconnection Agreement – This agreement is required for all Generation Systems that parallel with Otter Tail Power. Each of Otter Tail Power's tariffs contain standard interconnection agreements. There are different interconnection agreements depending upon the size and type of Generation System. This agreement contains the terms and conditions upon which the Generation System is to be connected, constructed and maintained, when operated in parallel with Otter Tail Power. Some of the issues covered in the interconnection agreement are as follows;

- i) Construction Process
- ii) Testing Requirements
- iii) Maintenance Requirements
- iv) Firm Operating Requirements such as Power Factor
- v) Access requirements for Otter Tail Power personnel
- vi) Disconnection of the Generation System (Emergency and Non-emergency)
- vii) Term of Agreement
- viii) Insurance Requirements
- ix) Dispute Resolution Procedures

B) Operating Agreement – For Generation Systems that normally operate in parallel with Otter Tail Power, an agreement separate from the interconnection agreement, called the "operating agreement", is usually created. This agreement is created for the benefit of both the Interconnection Customer and Otter Tail Power operator and will be agreed to between the Parties. This agreement will be dynamic and is intended to be updated and reviewed annually. For some smaller systems, the operating agreement can simply be a letter agreement for larger and more intergraded Generation Systems the operating agreement will tend to be more involved and more formal. The operating agreement covers items that are necessary for the reliable operation of the Local and Otter Tail Power system. The items typically included in the operating agreement are as follows;

- i) Emergency and normal contact information for both Otter Tail Power operations center and for the Interconnection Customer
- ii) Procedures for periodic Generation System test runs.
- iii) Procedures for maintenance on Otter Tail Power that effect the Generation System.
- iv) Emergency Generation Operation Procedures

# Interconnection requirements

## 8. Testing Requirements

### A) Pre-Certification of equipment

The most important part of the process to interconnect generation with Local and Otter Tail Power's is safety. One of the key components of ensuring the safety of the public and employees is to ensure that the design and implementation of the elements connected to the electrical power system operate as required. To meet this goal, all of the electrical wiring in a business or residence, is required to be listed by a recognized testing and certification laboratory, for its intended purpose. Typically we see this as "UL" listed. Since Generation Systems have tended to be uniquely designed for each installation they have been designed and approved by Professional Engineers. As the number of Generation Systems installed increase, vendors are working towards creating equipment packages which can be tested in the factory and then will only require limited field testing. This will allow us to move towards "plug and play" installations. For this reason, this standard recognizes the efficiency of "pre-certification" of Generation System equipment packages that will help streamline the design and installation process.

An equipment package shall be considered certified for interconnected operation if it has been submitted by a manufacture, tested and listed by a nationally recognized testing and certification laboratory (NRTL) for continuous utility interactive operation in compliance with the applicable codes and standards. Presently generation paralleling equipment that is listed by a nationally recognized testing laboratory as having met the applicable type-testing requirements of UL 1741 and IEEE 929, shall be acceptable for interconnection without additional protection system requirements. An "equipment package" shall include all interface components including switchgear, inverters, or other interface devices and may include an integrated generator or electric source. If the equipment package has been tested and listed as an integrated package which includes a generator or other electric source, it shall not required further design review, testing or additional equipment to meet the certification requirements for interconnection. If the equipment package includes only the interface components (switchgear, inverters, or other interface devices), then the Interconnection Customer shall show that the generator or other electric source being utilized with the equipment package is compatible with the equipment package and consistent with the testing and listing specified for the package. Provided the generator or electric source combined with the equipment package is consistent with the testing and listing performed by the nationally recognized testing and certification laboratory, no further design review, testing or additional equipment shall be required to meet the certification requirements of this interconnection procedure. A certified equipment package does not include equipment provided by Otter Tail Power.

The use of Pre-Certified equipment does not automatically qualify the Interconnection Customer to be interconnected to Otter Tail Power. An application will still need to be submitted and an interconnection review may still need to be performed, to determine the compatibility of the Generation System with Otter Tail Power.

### B) Pre-Commissioning Tests

#### i) Non-Certified Equipment

##### (1) Protective Relaying and Equipment Related to Islanding

(a) Distributed generation that is not Type-Certified (type tested), shall be equipped with protective hardware and/or software designed to prevent the Generation from being connected to a de-energized Otter Tail Power's distribution system.

(b) The Generation may not close into a de-energized Otter Tail Power distribution

## Interconnection requirements

system and protection provided to prevent this from occurring. It is the Interconnection Customer's responsibility to provide a final design and to install the protective measures required by Otter Tail Power. Otter Tail Power will review and approve the design, the types of relays specified, and the installation. Mutually agreed upon exceptions may at times be necessary and desirable. It is strongly recommended that the Interconnection Customer obtain Otter Tail Power written approval prior to ordering protective equipment for parallel operation. The Interconnection Customer will own these protective measures installed at their facility.

- (c) The Interconnection Customer shall obtain prior approval from Otter Tail Power for any revisions to the specified relay calibrations.

### C) Commissioning Testing

The following tests shall be completed by the Interconnection Customer. All of the required tests in each section shall be completed prior to moving on to the next section of tests. Otter Tail Power operator has the right to witness all field testing and to review all records prior to allowing the system to be made ready for normal operation Otter Tail Power shall be notified, with sufficient lead time to allow the opportunity for Otter Tail Power personnel to witness any or all of the testing.

- i) Pre-testing The following tests are required to be completed on the Generation System prior to energization by the Generator or Otter Tail Power. Some of these tests may be completed in the factory if no additional wiring or connections were made to that component. These tests are marked with a "\*\*"

- (1) Grounding shall be verified to ensure that it complies with this standard, the NESC and the NEC.
- (2) \* CT's (Current Transformers) and VT's (Voltage Transformers) used for monitoring and protection, shall be tested to ensure correct polarity, ratio and wiring
- (3) CT's shall be visually inspected to ensure that all grounding and shorting connections have been removed where required.
- (4) Breaker / Switch tests – Verify that the breaker or switch cannot be operated with interlocks in place or that the breaker or switch cannot be automatically operated when in manual mode. Various Generation Systems have different interlocks, local or manual modes etc. The intent of this section is to ensure that the breaker or switches controls are operating properly.
- (5) \* Relay Tests – All Protective relays shall be calibrated and tested to ensure the correct operation of the protective element. Documentation of all relay calibration tests and settings shall be furnished to Otter Tail Power operator.
- (6) Trip Checks - Protective relaying shall functionally tested to ensure the correct operation of the complete system. Functional testing requires that the complete system is operated by the injection of current and/or voltage to trigger the relay element and proving that the relay element trips the required breaker, lockout relay or provides the correct signal to the next control element. Trip circuits shall be proven through the entire scheme (including breaker trip)

For factory assembled systems, such as inverters the setting of the protective elements may occur at the factory. This section requires that the complete system including the wiring and the device being tripped or activated is proven to be in working condition through the injection of current and/or voltage.

## Interconnection requirements

(7) Remote Control, SCADA and Remote Monitoring tests – All remote control functions and remote monitoring points shall be verified operational. In some cases, it may not be possible to verify all of the analog values prior to energization. Where appropriate, those points may be verified during the energization process

(8) Phase Tests – the Interconnection Customer shall work with Otter Tail Power operator to complete the phase test to ensure proper phase rotation of the Generation and wiring.

(9) Synchronizing test – The following tests shall be done across a open switch or racked out breaker. The switch or breaker shall be in a position that it is incapable of closing between the Generation System and Otter Tail Power for this test. This test shall demonstrate that at the moment of the paralleling-device closure, the frequency, voltage and phase angle are within the required ranges, stated in IEEE 1547 . This test shall also demonstrate that is any of the parameters are outside of the ranges stated; the paralleling-device shall not close. For inverter-based interconnected systems this test may not be required unless the inverter creates fundamental voltages before the paralleling device is closed.

ii) On-Line Commissioning Test – the following tests will proceed once the Generation System has completed Pre-testing and the results have been reviewed and approved by Otter Tail Power operator. For smaller Generation Systems Otter Tail Power may have a set of standard interconnection tests that will be required. On larger and more complex Generation Systems the Interconnection Customer and Otter Tail Power operator will get together to develop the required testing procedure. All on-line commissioning test shall be based on written test procedures agreed to between Otter Tail Power operator and the Interconnection Customer.

Generation System functionally shall be verified for specific interconnections as follows:

(1) Anti-Islanding Test – For Generation Systems that parallel with the utility for longer then 100msec.

(a) The Generation System shall be started and connected in parallel with Otter Tail Power source

(b) Otter Tail Power source shall be removed by opening a switch, breaker etc.

(c) The Generation System shall either separate with the local load or stop generating

(d) The device that was opened to remove Otter Tail Power source shall be closed and the Generation System shall not reparallel with Otter Tail Power for at least 5 minutes.

iii) Final System Sign-off.

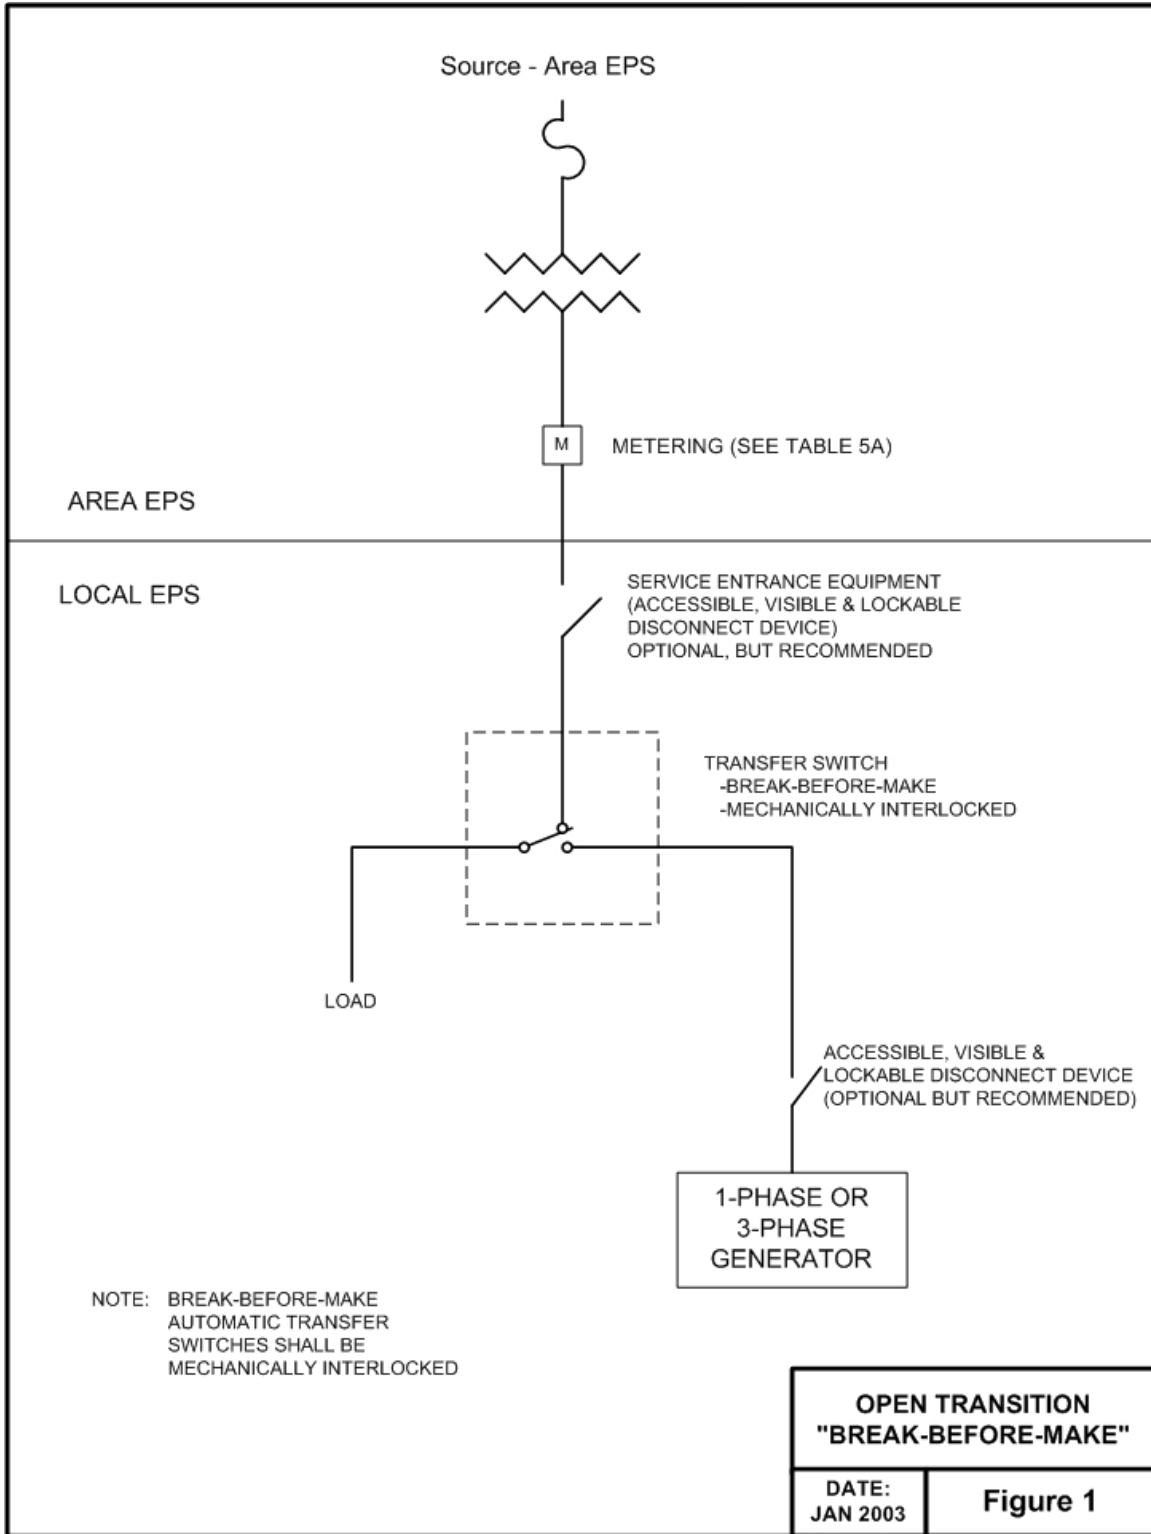

(1) To ensure the safety of the public, all interconnected customer owned generation systems which do not utilize a Type-Certified system shall be certified as ready to operate by a Professional Electrical Engineer registered in the State of South Dakota, prior to the installation being considered ready for commercial use.

iv) Periodic Testing and Record Keeping

## Interconnection requirements

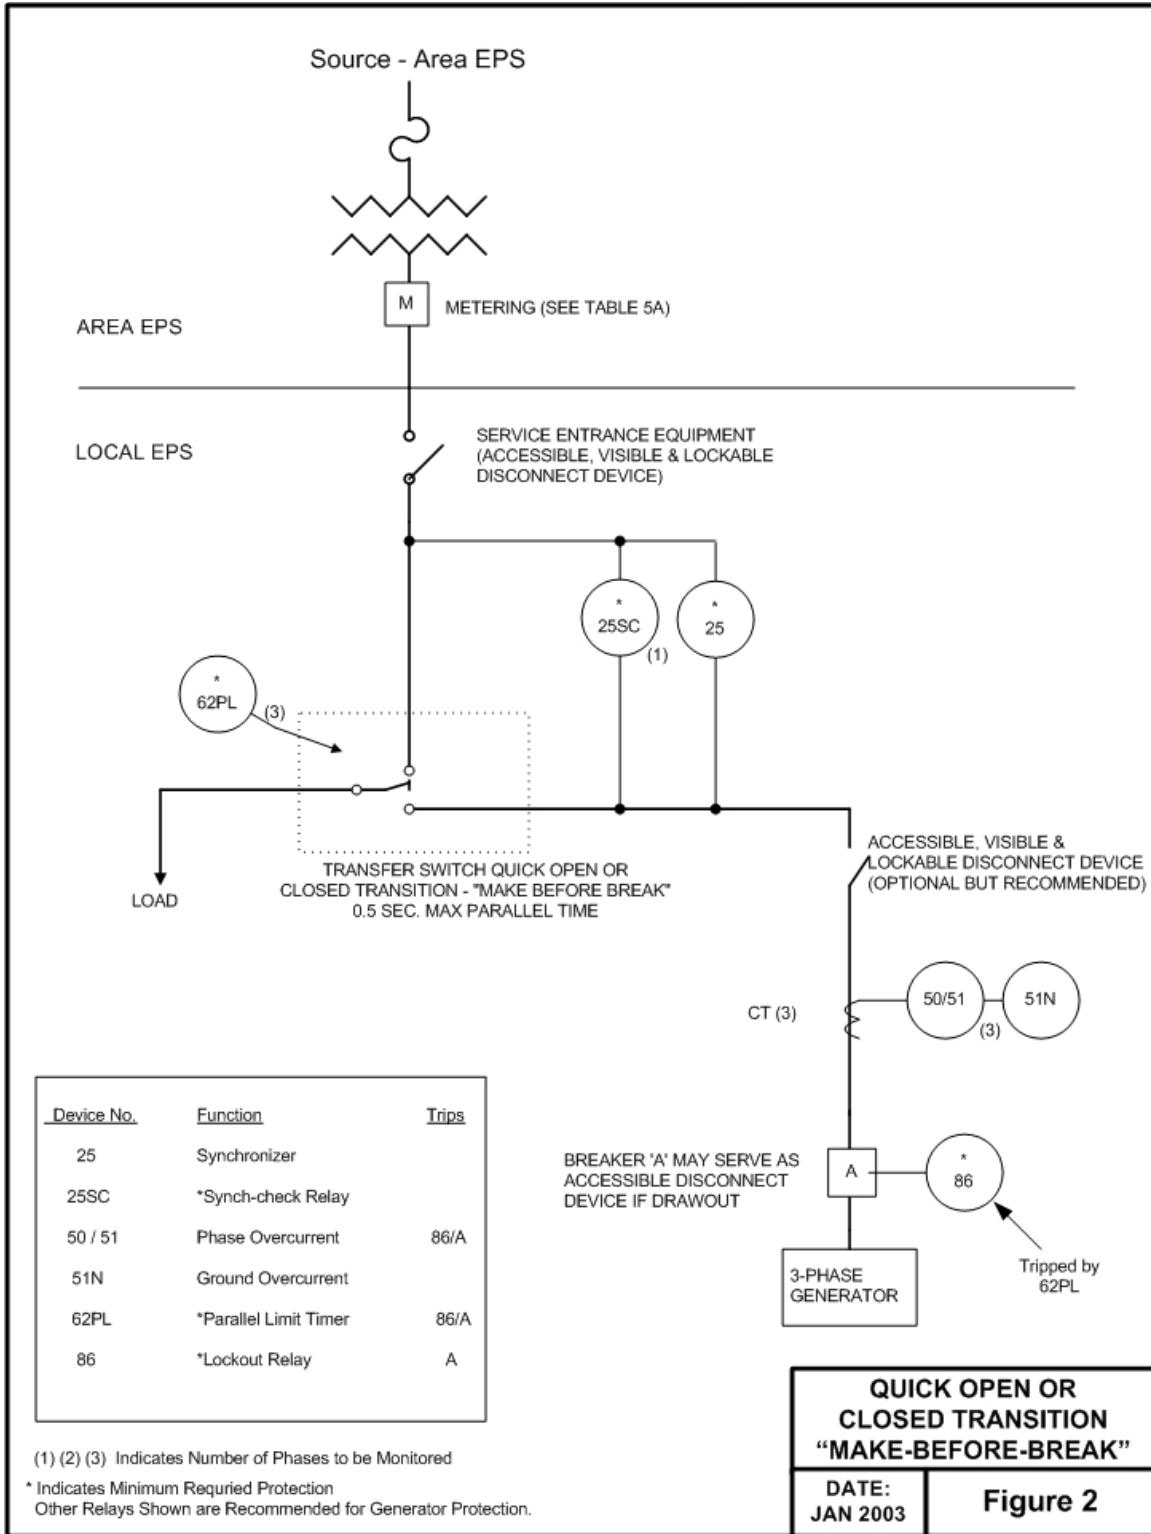

- (1) Any time the interface hardware or software, including protective relaying and generation control systems are replaced and/or modified, Otter Tail Power operator shall be notified. This notification shall, if possible, be with sufficient warning so that Otter Tail Power personnel can be involved in the planning for the modification and/or witness the verification testing. Verification testing shall be completed on the replaced and/or modified equipment and systems. The involvement of Otter Tail Power personnel will depend upon the complexity of the Generation System and the component being replaced and/or modified. Since the Interconnection Customer and Otter Tail Power operator are now operating an interconnected system. It is important for each to communicate changes in operation, procedures and/or equipment to ensure the safety and reliability of the Local and Otter Tail Power.
- (2) All interconnection-related protection systems shall be periodically tested and maintained, by the Interconnection Customer, at intervals specified by the manufacture or system integrator. These intervals shall not exceed 5 years. Periodic test reports and a log of inspections shall be maintained, by the Interconnection Customer and made available to Otter Tail Power operator upon request. Otter Tail Power operator shall be notified prior to the period testing of the protective systems, so that Otter Tail Power personnel may witness the testing if so desired.
  - (a) Verification of inverter connected system rated 15kVA and below may be completed as follows; The Interconnection Customer shall operate the load break disconnect switch and verify the Generator automatically shuts down and does not restart for at least 5 minutes after the switch is close
  - (b) Any system that depends upon a battery for trip/protection power shall be checked and logged once per month for proper voltage. Once every four years the battery(s) must be either replaced or a discharge test performed. Longer intervals are possible through the use of "station class batteries" and Otter Tail Power operator approval.

# **I. INTRODUCTION**

## **A. OBJECTIVES**

The purpose of this handbook is to provide technical guidelines to assist the Applicant desiring to interconnect with the Otter Tail Power Company electric system (“Otter Tail System”) in establishing the interconnection in an efficient and consistent manner to meet the minimum requirements for safe and reliable operation of the parallel interconnection. This document is designed to comply with the North American Electric Reliability Council’s (NERC) compliance directive to establish facility connection standards.

These guidelines are not intended to be a design specification or instruction manual but to provide the technical guidance needed to achieve the following:

- Ensure the safety of the general public and Otter Tail personnel.
- Avoid degradation to the reliability and service of all users of the Otter Tail System.
- Minimize the possible damage to the property of the general public, Otter Tail Customers, and Otter Tail.
- Minimize adverse operating conditions on the Otter Tail System.
- Permit the Applicant to operate in parallel with the Otter Tail System in a safe, reliable and efficient manner.
- Accurately measure and account for all injections and extractions from the interconnected system.

## **B. COMPANY CONTACTS**

Any Applicant intending to interconnect to the Otter Tail System is required to complete Attachment C - Application for Interconnection To The Otter Tail Power Company Electric System (“Application”), as outlined in the Company’s *Control Area Services and Operations Tariff*, Part III -- Procedures and Requirements for Facility Interconnections in Otter Tail Power Company’s Control Area (“Interconnection Procedures”).

### **1. Otter Tail Power Company Retail Customers**

To initiate the interconnection process, all existing Otter Tail Power Company Retail Customers should contact:

Manager, Industrial Services  
Otter Tail Power Company  
215 South Cascade Street  
Fergus Falls, MN 56538-0496  
(218) 739-8355; [dbartsch@otpc.com](mailto:dbartsch@otpc.com)

## **2. New Interconnection Applicants**

All new interconnection applicants should initiate the interconnection process by contacting:

Transmission Administrator  
Otter Tail Power Company  
215 South Cascade Street  
Fergus Falls, MN 56538-0496  
(218) 739-8474; [ddavenport@otpc.com](mailto:ddavenport@otpc.com)

### **C. AUTHORITY**

State and federal regulatory agencies having jurisdiction over Otter Tail's System, require Otter Tail to provide safe and reliable service. The Federal Energy Regulatory Commission (FERC), having authority over the entire interconnected electric grid and all wholesale transactions, has established the NERC operating guidelines as the guiding standards and practices for all jurisdictional utilities. Otter Tail adheres to the existing (or amended) manuals, standards, and guidelines of the NERC, Midwest Independent Transmission System Operator, Inc. (MISO), Applicable Reliability Council, or any successor agency assuming or charged with similar responsibilities related to the operation and reliability of the North American electric interconnected transmission grid. Any Applicant desiring to interconnect to the Otter Tail System is therefore required to comply with Otter Tail's requirements.

### **D. INTERCONNECTION PROCEDURES**

The interconnection procedures for establishing interconnection to the Otter Tail System are identified in Part III - Procedures and Requirements for Facility Interconnections in Otter Tail Power Company's Control Area ("Interconnection Procedures") of Otter Tail's Control Area Services and Operations Tariff ("CASOT") and provided to the Applicant with a copy of these guidelines. The CASOT may also be found on the Company's website at <http://www.otpc.com>.

### **E. OTTER TAIL POWER COMPANY AS A CONTROL AREA OPERATOR**

Otter Tail Power Company is the Control Area Operator for a large geographic area comprising parts of Minnesota, North Dakota, and South Dakota. In light of this operating responsibility, some requirements set forth in these guidelines will be applicable to all interconnections made within the Otter Tail Control Area and not exclusively for Otter Tail Customers. Any operations of interconnected equipment or facilities will fall under the direction of the Control Area Operator.

All facilities or entities scheduling within, in, or out of the Otter Tail's Control Area will be required to sign the Control Area Services and Operations Tariff (CASOT). New interconnections that will not be participating in wholesale transactions or scheduling within, in, or out of Otter Tail's Control Area may be required to sign a modified agreement for control area services, as some control area services may still be required for those facilities.

## **II. GENERAL POLICY AND REQUIREMENTS**

### **A. COMPLIANCE WITH INTERCONNECTION REQUIREMENTS**

The requirements set forth by this document are intended to comply with the Public Utility Regulatory Policies Act (PURPA), the FERC's final rules on Open Access (FERC Orders 888, 889), all state and federal regulatory agency requirements and other applicable requirements of other entities related to owners and operators of electric systems and associated interconnected facilities such as NERC, MISO, Applicable Reliability Council, or any successor agency assuming or charged with similar responsibilities related to the operation and reliability of the North American electric interconnected transmission grid. While these requirements comply with today's industry standards, the electric industry is undergoing a major restructuring and changes can be expected. The applicant needs to work closely with Otter Tail to keep up to date on the interconnection requirements.

It is the responsibility of the Applicant to obtain all permits and approvals of the governing bodies and to comply with all applicable electrical and safety codes.

The Applicant is responsible for ensuring that the interconnection complies with all NERC, MISO, and Applicable Reliability Council planning, design, and operating standards – including periodic unit testing.

### **B. RESPONSIBILITY AND APPROVAL**

Otter Tail does not assume responsibility for protection of the Applicant's interconnected equipment or of any other Applicant equipment. The Applicant is solely responsible for protecting its equipment to prevent damage from faults, imbalances, or other disturbances on the Otter Tail System. Otter Tail will not be responsible for damage to the Applicant's equipment due to out-of-phase reclosing. Such an event will likely cause damage to the Applicant's equipment and must be carefully addressed. Technical aspects addressing protection requirements are expanded in Section V.

Approval of the proposed interconnection only ensures that Otter Tail has reviewed the interconnection to make certain that the Otter Tail System can be maintained and that other Otter Tail customers are not adversely affected by operation of the interconnecting facilities. Otter Tail will not assume any liability or responsibility for Applicant-owned equipment.

### **C. FINANCIAL OBLIGATION ASSOCIATED WITH INTERCONNECTION TO THE OTTER TAIL SYSTEM**

Through appropriate agreement(s), Otter Tail may make provisions to recover costs. The following expense categories are examples of (but not all-inclusive of) items reimbursable to Otter Tail:

- Meter installation, tests, maintenance, parts and related labor
- Meter reading and scheduling
- Telemetry installation, tests, maintenance, parts and related labor
- Operating expenses, including communication circuits
- Study analysis and related expenses
- Securing regional reliability organization or equivalent acceptance
- Modifications to the Otter Tail System and related labor/engineering
- Protective device installation/equipment cost and related labor
- Protective device settings review and coordination.
- Review of design, inspection and testing costs
- Programming costs to incorporate generation and tie-line data into Otter Tail's energy management system
- Land, rights-of-way, licensing, engineering, etc.
- Control Area Services costs

### **D. FINANCIAL PENALTIES**

If operation of the Applicant's Facility causes Otter Tail to be out of compliance with any applicable rules, regulations, and/or requirements of NERC, MISO, Applicable Reliability Council, or any successor agency assuming or charged with similar responsibilities related to the operation and reliability of the North American electric interconnected transmission grid, and if Otter Tail is assessed a penalty, fee, or charge for such non-compliance, said penalty will be passed through to the Applicant.

### **E. REQUESTS FOR TRANSMISSION SERVICE**

The ability to interconnect to the Otter Tail system does not mean the Applicant can deliver power over Otter Tail's facilities at all times and to any location. This determination is made under the Transmission Provider's Tariff and through reservation of transmission service. If the Applicant intends to wheel power over Otter Tail's transmission facilities, the Applicant must contact the Midwest ISO concerning obtaining transmission service.

### **III. COMMON INTERCONNECTION REQUIREMENTS AND RESPONSIBILITIES**

#### **A. SAFETY AND ISOLATING DEVICES**

At the Point of Interconnection to the Otter Tail System, an isolating device, which is typically a disconnect switch, shall be provided that physically and visibly isolates the Otter Tail System from the Applicant's Facilities. All switchgear that could energize equipment shall be visibly identified (tagged), so that all maintenance crews can be made aware of the potential hazards. Such devices shall:

- Simultaneously open all phases (gang-operated) to the connected facilities.
- Be accessible by Otter Tail and may be under Otter Tail System Operator jurisdiction.
- Be lockable in the open position by Otter Tail.
- Not be operated without advance notice to either party, unless an emergency condition requires that the device be opened to isolate the interconnected facilities.
- Be suitable for safe operation under the conditions of use.

Otter Tail personnel may lock the device in the open position and install safety grounds if:

- It is necessary for the protection of maintenance personnel when working on deenergized circuits.
- The interconnected Facility or Otter Tail equipment presents a hazardous condition.
- The interconnected Facility interferes with the operation of the Otter Tail System.
- The Otter Tail System interferes with the operation of the interconnected Facility.

#### **B. CONTROL AND PROTECTION**

Otter Tail plans its protective relays and control schemes to provide for personnel safety and equipment protection and to minimize disruption of services during disturbances. Interconnections onto the Otter Tail System usually require additions or modifications of Otter Tail's protective relays and/or control schemes. New Interconnections must be compatible with Otter Tail's existing protective relay schemes. Sometimes the additions of voltage transformers (VTs), current transformers (CTs), or pilot schemes (transfer trip) are necessary, based on the Point of Interconnection. Exact protective requirements are outlined in Section V.

#### **C. DISPATCHING AND MAINTENANCE**

Otter Tail operates and maintains its system to provide reliable customer service while meeting the seasonal and daily peak loads even during equipment outages and disturbances. Project integration requires that the equipment at the Point of Interconnection not restrict timely outage coordination, automatic switching or equipment maintenance scheduling. Preserving reliable

service to all Otter Tail customers is essential and may require additional switchgear, equipment redundancy, or bypass capabilities at the Point of Interconnection for acceptable operation of the system.

The generator will be expected to supply up to maximum available reactive capability and/or to adjust generation levels including reducing to zero if requested by the System Operator. This will always be for reliability purposes.

#### **D. REMEDIAL ACTION SCHEME**

The Otter Tail System has been developed with careful consideration for system stability and reliability during disturbances. The type of connection, size of the load, breaker configurations, load characteristics, and the ability to set protective relays will affect where and how the Point of Interconnection is made. The Applicant may be required to participate in special protection schemes, called remedial action schemes (RAS) such as generator dropping, load shedding, or load tripping. The portion of the transmission path capacity that the Applicant uses determines the pro rata share of RAS. If RAS participation is required, the Applicant and Otter Tail will jointly plan and coordinate the RAS implementation.

#### **E. STATION SERVICE**

Power that is provided for local use at a substation to operate lighting, heat and auxiliary equipment is termed station service. Alternate station service is a backup source of power, used only in emergencies or during maintenance when primary station service is not available.

Station service power is the responsibility of the Applicant. The station service requirements of the new facilities, including voltage and reactive requirements, shall not impose operating restrictions on the Otter Tail Transmission System beyond those specified in applicable NERC, MISO, and Applicable Reliability Council reliability criteria.

Appropriate provisions for station service and alternate station service will be determined during the interconnection planning process. Generally, the local utility will be the preference provider of primary station service unless it is unable to serve the load or costs to connect to the local utility are prohibitive.

The Applicant must provide metering for station service and alternate station service, as specified by the metering section of this document, or work out other acceptable arrangements.

## **F. INSPECTION, TEST, CALIBRATION AND MAINTENANCE**

The Applicant has full responsibility for the inspection, testing, calibration and maintenance of its equipment, up to the Point of Interconnection, consistent with the Interconnection and Operating Agreement.

### **1. Pre-energization Inspection and Testing**

Before initial energization, the Applicant shall develop an Inspection and Test Plan for pre-energization and energization testing. Otter Tail will review and approve the test plan prior to the test. Any costs incurred by Otter Tail as a result of the inspection and testing will be passed through to the Applicant. The Applicant will also be responsible for any additional tests that may be required by Otter Tail but were not specified in the Applicant's Inspection and Test Plan. The Applicant shall provide Otter Tail with copies of all drawings, specifications, and test records of the interconnection equipment and pertinent to the interconnected operation for Otter Tail's records.

### **2. Calibration and Maintenance**

#### **a. Metering Equipment**

Upon installation of, and at Applicant's expense, Otter Tail shall inspect and test all Metering Equipment. Thereafter, the meter testing frequency shall, at a minimum, be based on industry accepted practices and guidelines outlined in ANSI C12.1. Otter Tail's present testing practices are based on the type of metering situation and the jointly agreed-to requirements of both parties involved. Typically, the metering equipment at non-Otter Tail generation/interconnection sites is tested every three years. If requested to do so by Applicant, Otter Tail shall inspect or test Metering Equipment more frequently than every three years, at the expense of the Applicant. Any current or potential transformers that are used for metering will adhere to the "Accuracy Classifications for Metering" listed in ANSI C57.13.

#### **b. All Other Electrical Equipment**

The Applicant shall maintain its facilities and equipment, to the extent they might reasonably be expected to have an impact on the operation of the Otter Tail Transmission System and Otter Tail's other systems: (1) in a safe and reliable manner; (2) in accordance with Good Utility Practice; (3) in accordance with applicable operational and/or reliability criteria, protocols, and directives, including those of NERC, MISO, Applicable Reliability Council, or any successor agency assuming or charged with similar responsibilities; and (4) in accordance with the provisions of the Interconnection and Operating Agreement and any attachment, appendix or exhibit thereof.

## **G. ANCILLARY SERVICES**

The Applicant is required to obtain or provide for ancillary services (or portions of such services as required by FERC or NERC) for any electric load served from the interconnected electric grid. The Otter Tail Control Area provides ancillary services, including load regulation, load imbalance, load following, voltage control, scheduling, dispatching, generation regulation, and generation imbalance, as defined in the reliability policies and criteria by NERC, MISO, Applicable Reliability Council, or any successors assuming or charged with similar responsibilities.

The Applicant will be required to sign a Control Area Services and Operations Tariff which will specify which ancillary services the Applicant is required to take and/or make provisions for. Otter Tail will then determine the telemetering, controls, and metering that will be required to integrate the load or Facility into the Control Area and to provide the necessary ancillary services.

Ancillary services are also required for such an event where the Applicant's generation unit may trip off-line requiring the Company to provide for the Applicant's loss of generation. Therefore, any generation Applicant operating in long term parallel to the Otter Tail System to serve its own electric load must provide for the reserve capacity requirements, operating (spinning) and non-spinning reserve, reserved load regulating capability, unit cycling capability to satisfy NERC Control Performance Criteria, have the ability to determine actual after-the-fact load and generation, and have the delivery system capacity to receive emergency power. These services can be provided in whole or in part through Otter Tail services, by the Applicant, or by purchases from other utilities. However, the Applicant must confirm with Otter Tail that it is in compliance at all times with these requirements.

## **H. METERING**

Metering is required for all interconnections to the Otter Tail System. Metering must be designed such that load can be identified separately from the net generator output. Such net output is the kWh output of the generator less the generation station auxiliary load. In addition, each unit must be capable of being URGE tested individually (see Section IV.B.1).

Modifications to the revenue metering are usually required. In general, the metering equipment will be modified to measure both delivered and received energy (both Watts & VARs). This can be accomplished by adding additional watt-hour and VAR-hour meters equipped with detents, or a multi-function bi-directional meter. Either installation will allow proper measurement of both real and reactive energy in both directions. The metering installation shall be electrically connected on the line side of the main generator disconnect thus allowing the meter to be read even when the generator is not running. For substation metering, the meter may be located on the low side of the step-down transformer, but the meter must be able to compensate for transformer energy losses from the high side of the transformer. Refer to Appendix A, Otter Tail Metering and Telemetry Requirements, for additional metering information.

## I. TELEMETRY

The requirements for telemetry are based on the need of the System Control Center to protect all users of the transmission and distribution system from unacceptable disturbances. The need for requiring telemetry may include the ability to monitor the following conditions:

- Detecting Facility backfeed onto otherwise de-energized lines
- Providing information necessary for reliable operation of Otter Tail equipment (feeders, substation, etc.) during normal and emergency operation
- Providing information necessary for the reliable dispatch of generation

Telemetry is required by Otter Tail when:

- The possibility of islanding a portion of Otter Tail's system exists (typical of smaller feeders).
- 1 MW or larger generation becomes a significant portion of a feeder's total load (typically 6 to 10 MW).
- There is the potential for multiple Applicants to have generators on the same substation and/or feeders.
- There is the potential for backfeeding onto the Otter Tail System or islanding a portion of Otter Tail's System.
- The Facility plans to provide its own ancillary services.
- There is intent to sell power and energy over Otter Tail facilities.
- The Facility is required to meet the manual load shed requirement.
- 41.6 kV or 69 kV substations are equipped with circuit breakers and for all substations classified at 115 kV and above.
- FERC requires telemetering for normally open or emergency tie connections.

If "islanding" is a possibility, it will be identified during the interconnection study process. In such instances, the following telemetry may be required:

- Real and reactive power flow for each generator (kW and kVAr)
- Voltage representative of the Otter Tail service to the Facility
- Status (open/close) of Facility and interconnection breaker(s)
- Position of incoming and tie breakers or switches
- Energy output of the generators (kWh)
- Applicant load from Otter Tail service (kW and kVAr)

When telemetry is required, the Applicant must provide the communications medium to Otter Tail. If a telephone circuit is used, the Applicant must also provide the telephone circuit protection and coordinate the RTU addition with Otter Tail. Additional Telemetry Requirements can be found in Appendix A. High capacity interconnections may require redundant metering and telemetering.

## **J. SUPERVISORY CONTROL AND DATA ACQUISITION (SCADA) REQUIREMENTS**

SCADA indication of real and reactive power flows and voltage levels is required. If the connection is made directly to another utility's transmission system, SCADA control and status indication requirements shall be jointly determined. SCADA control and status indication of the power circuit breakers and associated isolating switches used to connect with Otter Tail may be required. SCADA control of breakers and isolating switches that are located at other than the Point of Interconnection is not normally required, although status indication may be necessary.

All substations with a 41.6 kV or greater circuit breaker and all generation 5 MW or greater shall provide SCADA for the circuit breaker to the Control Area Operator. The following equipment data and statuses must be provided in a 6 second or less periodicity to the Control Area Operator:

- Breaker position
- Motor operated disconnect position
- Transmission line flow and alarming
- Bus voltage and alarming battery and associated equipment status
- Protective relaying AC and DC voltage status
- Protective relay communication channel status
- Transformer and associated equipment status
- Lockout relay status
- Capacitor/reactor status
- Other points as necessary to provide control and indication

## **K. ENERGIZATION OF OTTER TAIL EQUIPMENT BY THE APPLICANT**

No Applicants, independent of interconnection type or generator size, shall energize a de-energized Otter Tail circuit. The necessary control devices shall be installed by the Applicant on the equipment to prevent the energization of a de-energized Otter Tail circuit by the Applicant's interconnected Facility. Connection may be accomplished only via synchronization with the Otter Tail System. All interconnecting circuit breakers/devices and all breakers/devices that tie another source to Otter Tail will require synchro-check relaying. Authorization to energize a circuit may only be provided by the Control Area Operator.

## **IV. INTERCONNECTION FACILITY OPERATING LIMITS**

Operating criteria have been defined for Applicant Facilities interconnecting with the Otter Tail System in order to minimize the impact that adverse operating conditions could have on the electric service provided to other customers on the Otter Tail System. The interconnection technical requirements are outlined in this section and where applicable, requirements specific to size and/or type of interconnection are noted.

### **A. VOLTAGE**

The Applicant's equipment shall not cause excessive voltage excursions. The Applicant shall provide an automatic means of disconnecting its equipment from the Otter Tail System within three seconds if the steady state voltage cannot be maintained within the required tolerance.

Most of Otter Tail's system at 12.5 kV and below is voltage regulated. When the interconnection is with a portion of the Otter Tail delivery system that is regulated, then the Applicant shall be capable of tolerating steady-state voltage fluctuations of  $\pm 5$  percent of the nominal voltage level.

Transmission and transmission transformed rates do not include a provision for voltage regulation. For interconnections to the transmission system (generally above 12.5 kV), voltage levels  $\pm 10$  percent from nominal can be expected. If the Applicant's equipment cannot operate within the above range, the Applicant may need to provide regulation equipment to limit voltage level excursions.

If the design of the Applicant's Facility is such that islanded conditions are possible, appropriate zero sequence sources must also be provided. The usual customer voltage concern refers to line-line values, but generation installed on distribution lines must also control the line-ground voltage during an islanded condition.

Consistent with the Applicable Reliability Council's system performance criteria and technical study guidelines, the Otter Tail System is designed to avoid experiencing dynamic voltage dips below .70 pu due to external faults or other disturbance initiators. The Applicant should allow sufficient dead band in its voltage regulation equipment control to avoid reacting to dynamic voltage dips.

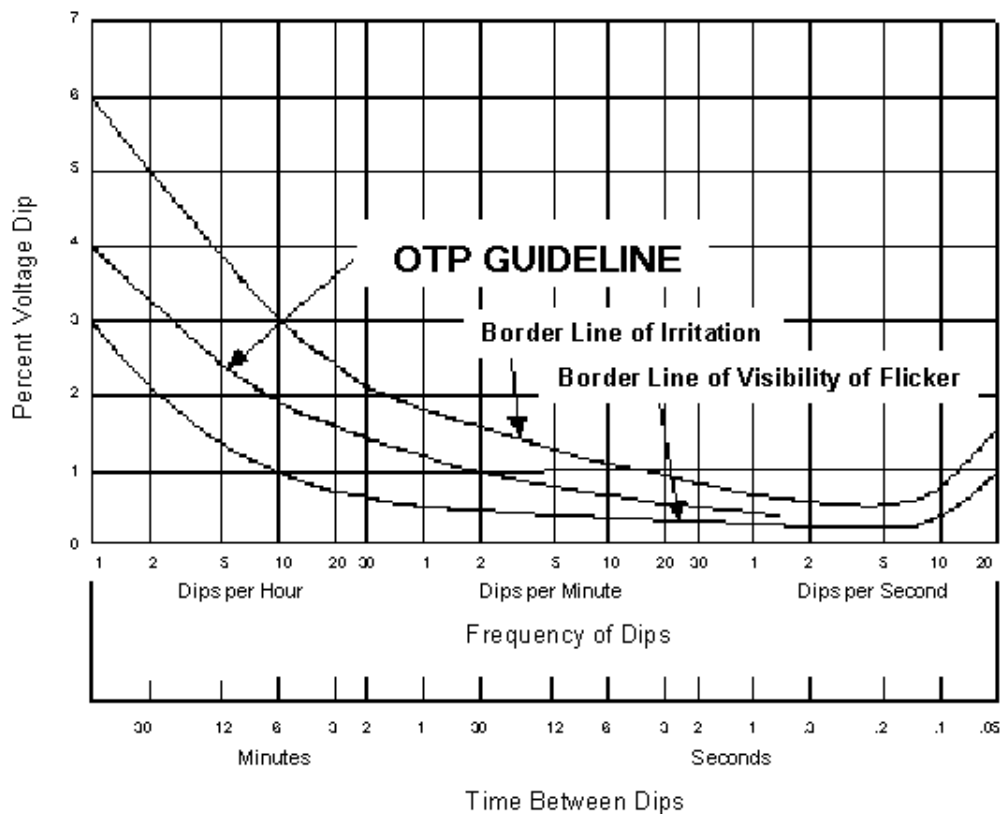

### **B. FLICKER**

Voltage fluctuations may be noticeable as visual lighting variations (flicker) and can damage or disrupt the operation of electronic equipment. The flicker limits defined below are applicable to all interconnections made to the Otter Tail system. In the case where the Applicant owns a dedicated line so that Otter Tail's other customers will be protected, a waiver may be permitted.

IEEE P1547, *Draft Standard for Distributed Resources Interconnected with Electric Power Systems*, has additional flicker requirements under development. This document is an ever-evolving document and will implement the additional IEEE requirements upon adoption of this draft standard by IEEE.

Flicker tests for wind powered sources shall be conducted in accordance with IEC 61000-4-15.

Applicants are not allowed to produce flicker to adjacent customers that exceeds the Otter Tail guideline shown below (Figure 1). The Applicant will be responsible and liable for corrections if the interconnecting Facility is the cause of objectionable flicker levels.

**Figure 1. Otter Tail Voltage Flicker Guideline**

### C. HARMONICS

Harmonics can cause telecommunication interference, increase thermal heating in transformers, disable solid state equipment and create resonant overvoltages. In order to protect equipment from damage, harmonics must be managed and mitigated. The Applicant's interconnecting equipment shall not introduce excessive distortion to the Otter Tail System's voltage and current waveforms per IEEE 519-1992.

The harmonic distortion is defined as the ratio of the root mean square (rms) value of the harmonic to the rms value of the fundamental voltage or current. The harmonic distortion measurements shall be made at the point of interconnection between the Applicant and the Otter Tail System and shall be within the limits specified in the tables below. Otter Tail advises the Applicant to account for harmonics during the early planning and design stages. Refer to Tables 1 and 2 for voltage distortion limits.

**Table 1. Voltage Distortion Limits**

<b>Bus Voltage At PCC</b>	<b>Individual Voltage Distortion IHD %</b>	<b>Total Voltage Distortion THD %</b>
Below 69 kV	3.0	5.0
69 kV to 115 kV	1.5	2.5
115 kV and above	1.0	1.5

*Source: IEEE 519, Table 11.1*

**Table 2. Current Distortion Limits For Non-Linear Loads At The Point Of Common Coupling (PCC) From 120 To 69,000 Volts**

<b>Maximum Harmonic Current Distribution in % of Fundamental Harmonic Order (Odd Harmonics)</b>						
<b>I(sc)/I(l)</b>	<b>&lt;11</b>	<b>11&lt;h&lt;17</b>	<b>17&lt;h&lt;23</b>	<b>23&lt;h&lt;35</b>	<b>35&lt;h</b>	<b>THD</b>
20	4.0	2.0	1.5	0.6	0.3	5.0
20-50	7.0	3.5	2.5	1.0	0.5	8.0
50-100	10.0	4.5	4.0	1.5	0.7	12.0
100-1000	12.0	5.5	5.0	2.0	1.0	15.0
1000	15.0	7.0	6.0	2.5	1.4	20.0

Where:  
I(sc) = Maximum short circuit current at PCC  
I(l) = Maximum load current (fundamental frequency) at PCC  
PCC = Point of Common Coupling between Applicant and utility

Generation equipment is subject to the lowest I(sc)/I(l) values  
Even harmonics are limited to 25% of odd harmonic limits given above

*Source: IEEE 519, Table 10.3*

A special study will be required for situations when the fault to load ratio is less than 10.

Lower order harmonics, particularly the third and ninth harmonics, will often be of more concern to the owner of the generator. These are often related to generator grounding, and to the type of transformer connections that may be involved. It is to the Applicant's advantage to work these problems out early enough so that Applicant and Otter Tail equipment can be acquired to achieve proper control.

**D. FAULT CURRENT**

The combined available fault current of the Otter Tail System and the Applicant's facilities must not overstress Otter Tail equipment. The Applicant shall provide any necessary provisions to satisfy this requirement. Except in unique circumstances, the designed maximum available fault current on the Otter Tail System depends upon the voltage level, as shown in the following table:

<u>Voltage</u>	<u>Maximum Available Fault</u>
4.16 kV	36 MVA
12.5 kV	108 MVA
41.6 kV	360 MVA
115 KV and greater	site specific

Protective equipment on the Otter Tail System is specified within these limits. If the installation of Applicant-owned equipment causes these fault current limits to be exceeded, the Applicant must install equipment to limit the fault current on the Otter Tail delivery system or compensate Otter Tail for the additional costs of installing equipment that will safely operate within the available fault current. The exact value of available fault depends upon location and circuit configuration and will be determined in the interconnection studies. The Applicant must work closely with Otter Tail at the time of interconnection design to determine the available fault current at the specific location of interconnection.

**E. MINIMUM POWER FACTOR REQUIREMENTS**

The Applicant will generally be expected to provide for its own as well as its customers reactive power requirements.

Some portions of the Otter Tail power system are in or adjacent to areas where other power suppliers (Municipals or Co-ops) utilize "ripple" load management systems. These systems employ an on/off keyed carrier signal (typically in the range of 150-400 Hz) injected into the power systems to address Applicant site load management devices. Installation of shunt capacitor banks, as may be required for power factor correction of induction machines, or for providing capacitive output capability, may cause degradation of the ripple signal strength due to shunting to ground of the ripple signal through the capacitor bank(s). To prevent such degradation, appropriate tuned blocking filters may be required.

## **1. Substation-Specific Power Factor Requirements**

The Otter Tail Transmission system is designed and operated assuming the power factor at the transmission side of the distribution transformer is 98 percent when load is within 10 percent of the forecasted system minimum or peak. Any interconnecting facility is expected to provide sufficient reactive power (leading or lagging) such that during these load periods the high side power factor does not exceed  $\pm 98$  percent.

If during normal operation (system intact or under transmission contingency conditions) the voltage in a portion of the Otter Tail System deviates from the voltage range described in Section IV.A., Otter Tail will survey the interconnected substation(s) believed to be contributing to the voltage concern and the Applicant may be asked to demonstrate, (either by metered values or by inventory of installed equipment) that the Applicant meets its reactive power obligation. Any deviations are required to be corrected immediately.

## **2. Generator-Specific Power Factor Requirements**

Self-service generators serving load will be expected to provide sufficient facilities and controls to operate their combined generation and load within a range of  $\pm 95$  percent power factor or be subject to the power factor charges associated with the service rate. All other generator Applicants are required to provide unity power factor, unless providing Reactive Supply and Voltage Control from Generation Source Service as described in the following section, Section IV.F.

## **F. REACTIVE SUPPLY AND VOLTAGE CONTROL FROM GENERATION SOURCES SERVICE – 10 MW OR LARGER**

Reactive Supply and Voltage Control from Generation Sources Service is a FERC defined ancillary service. Any generator providing such service to the Control Area Operator must be able to automatically control the voltage level by adjusting the machine's power factor within a continuous range of between  $\pm 90$  percent power factor based on the station's sum total name plate generating capability. The voltage set point that the generator needs to maintain will be established and adjusted as necessary by Otter Tail's System Operations Department.

The Voltage Control Response Rate (for synchronous generators, the exciter response ratio) is the speed with which the voltage-controlling device reacts to changes in the system voltage. The minimum response rate for a static excitation system shall have the exciter attain 95 percent of the exciter ceiling (maximum) voltage in 0.1 seconds. The exciter ceiling voltage shall be at least two times the exciter voltage at the rated full load value. For rotary exciters, the exciter response ratio shall be at least 2.0. The response ratio, ceiling voltage, and speed of response are defined in IEEE 421.2 1990.

Those generating Applicants choosing to provide Reactive Supply and Voltage Control from Generation Sources service must coordinate with existing voltage regulation devices. In most cases, this will be a concern for those generators connecting to voltage regulated distribution facilities (12.5 kV and below).

#### **G. FREQUENCY DURING DISTURBANCES**

Power system disturbances initiated by system events such as faults and forced equipment outages expose the system to oscillations in voltage and frequency. It is important that generators and lines remain in service for dynamic (transient) oscillations that are stable and damped.

To avoid large-scale blackouts that can result from excessive generation loss, major transmission loss, or load loss during a disturbance, underfrequency load shedding has been implemented by the Applicable Reliability Council. When system frequency declines, loads are automatically interrupted in steps occurring at 59.3, 59.0, and 58.7 Hz, respectively. Load shedding attempts to stabilize the system by balancing the generation and load. It is important that generators and lines remain connected to the system during frequency declines, both to limit the amount of load shedding required and to help the system avoid a complete collapse.

Additional voltage and frequency protection requirements for generators are found in Section VII.2.

### **V. PROTECTION REQUIREMENTS FOR ALL INTERCONNECTIONS**

This section specifies the protective and control requirements for interconnection requests. An important objective in the interconnection of facilities to Otter Tail's system is minimizing the potential hazard to life and property. A primary safety requirement is the ability to disconnect immediately when a fault is detected. The protection equipment for an interconnected facility must protect against faults within that facility and faults on the Otter Tail system. No new facility on the Otter Tail System should degrade the existing Otter Tail protection and control schemes or lower the levels of safety and reliability to other customers.

**Otter Tail's minimum protection requirements are designed and intended to protect Otter Tail's system only.** As a rule, neither party should depend on the other for the protection of its own equipment. Otter Tail shall assume no liability for damage to Applicant-owned Facilities resulting from miscoordination between the Applicant's protective device(s) and Otter Tail's protective devices. It is the Applicant's responsibility to protect its own system and equipment.

Several factors may determine what protective devices are required on the Applicant's interconnection. The following three major factors generally determine the type of protective devices required at the Point of Interconnection:

- The type and size of the Applicant's interconnecting equipment.
- The location of the Applicant on the Otter Tail System.
- The manner in which the installation will operate (one-way vs. two-way power flow).

The addition of the Applicant's Facility may also require modifying the Otter Tail System. These determinants will be made by Otter Tail during the preliminary portion of the interconnection study process. Each interconnection request will be handled individually and Otter Tail will solely determine the protective devices, system modifications, and/or additions required. Otter Tail will work with the Applicant to achieve an installation that meets the requirements of both the Applicant and Otter Tail. The Applicant shall bear all costs for protective devices and Otter Tail System modifications required to permit the operation of the parallel interconnection.

Otter Tail shall operate all Otter Tail-owned protective equipment at the interconnection to ensure that the protection and control requirements and objectives are met. During interconnection studies, Otter Tail will approve the proposed type of interconnection protective devices, ownership, operating details and equipment settings. **Do not confuse interconnection protection in this section with Applicant-provided Facility protection. Otter Tail is not liable or responsible for protection of the Applicant's facilities.**

#### **A. DISCONNECT**

A manual disconnect device should be installed to isolate the Otter Tail System from the Applicant's Facility. This device must have load break capability or means must be provided to trip off generation or load before operating the disconnect. This disconnect shall open all the poles except the neutral and shall provide a visible air gap to establish required clearances for maintenance and repair work of the Otter Tail system. A breaker that can be racked out into a visibly open position is also acceptable. Otter Tail may require the design to allow the application of safety grounds on the Otter Tail side of the disconnect (or breaker). OSHA lockout/tag requirements must be followed.

The disconnect (or breaker) must be accessible at all times to Otter Tail personnel. Disconnects should allow for padlocking in the open position with standard Otter Tail padlock. The Applicant shall not remove any padlocks or Otter Tail safety tags. The disconnect (or breaker) should be located outside of the building if possible. If not possible, Applicant must provide access to disconnect (or breaker) at all times (24 hour day phone number, guard desk, etc.) The disconnecting equipment must be clearly labeled. The disconnecting equipment shall be National Electrical Manufacturers Association (NEMA) approved for the specific application and location.

## **B. PROTECTIVE RELAY REQUIREMENTS**

Protective relays are required to promptly sense abnormal operating or fault conditions and initiate the isolation of the faulted area. Protective relays can generally be categorized into two major groups: industrial grade and utility grade. Utility grade relays have a higher degree of reliability and accuracy and are required in most cases. All Tie-line and Substation Interconnections shall use utility grade relays. The use of Otter Tail-approved industrial grade relays may be permitted on generation installations rated less than 100 kW. Protective relay settings on interconnect breakpoints must be approved by Otter Tail.

Otter Tail requires line-protective equipment to either 1) automatically clear a fault and restore power, or 2) rapidly isolate only the faulted section so that the minimum number of customers is affected by any outage. Fault-interrupting equipment should usually be located at the point of interconnection to OTP or as close to the interconnection point as practicable. High-speed fault clearing may be required to minimize equipment damage and potential impact to system stability. The need for high speed fault clearing shall be determined on a case-by-case basis by Otter Tail.

Additional protective relays are typically needed to protect the Generation Facility adequately. Most line relaying depends on generator size and type, number of generators, line characteristics (i.e., voltage, impedance, and ampacity), and the existing protection equipment connected to the Otter Tail System.

The Applicant shall install only Otter Tail approved relays on the part of their system that can impact the operation of the Otter Tail System. These relays must, at a minimum, meet IEEE Standards C37.90, C37.90.1, and C37.90.2. Applicants shall submit complete control and relaying documentation that pertains to protection of the Otter Tail System. Otter Tail may suggest or comment on other areas; however, the Applicant is responsible for the design of protection schemes protecting Applicant facilities.

The following tables (Tables 3 and 4) provide protective device recommendations necessary to protect Otter Tail equipment and its customers' equipment against electrical faults (short circuits), degraded voltage or frequency operation, unwanted power flow and inadvertent out of phase closing of breaker/switches. Some protective devices may or may not be required for Applicants as determined by Otter Tail on a case-by-case basis. Most line relaying depends on the existing system configuration, the existing protection, and line characteristics such as impedance, voltage, ampacity and available fault duty, at the location in question. Generator protection may depend upon the size of the generator, location and nature of interconnection and coordination requirements with Otter Tail protective systems. All necessary protective requirements will be identified during the interconnection study process.

**Table 3. Basic Line Protection Devices** (Protection Needs to be redundant at 115 kV and above for all applications. For lower voltage systems redundancy is only required for some specific areas of the system.)

Protection Device	Device Number	Less than 41.6 kV	41.6 kV to 69kV	115 kV	230 kV
Phase Overcurrent (Radial systems)	50/51	X	X		
Ground Overcurrent (Radial systems)	50/51N	X	X		
Phase Directional Overcurrent	67		X <sup>1</sup>	X	
Ground Directional Overcurrent or Transformer Neutral	67N 50/51N		X <sup>1</sup>	X	X
Distance Relay Zone 1	21Z1			X <sup>1</sup>	X
Distance Relay Zone 2	21Z2			X <sup>1</sup>	X
Distance Relay Carrier	21Z2C			X <sup>1</sup>	X
Ground Directional Overcurrent Carrier	67NC			X <sup>1</sup>	X
Distance Relay Carrier Block	21Z3C			X <sup>1</sup>	X
Pilot Wire	87L			X <sup>1</sup>	X
Permissive Overreaching Transfer Trip (POTT) or Hybrid	21/67T			X <sup>1</sup>	X
Power Fail Trip <sup>3</sup>	27		X <sup>1</sup>	X <sup>1</sup>	X <sup>1</sup>
Direct Transfer Trip	TT		X <sup>2</sup>	X <sup>2</sup>	X <sup>2</sup>

<sup>1</sup> May be required depending on local circuit configurations.

<sup>2</sup> Transfer trip may be required on interconnections depending on Otter Tail circuit configuration and loading, as determined by Otter Tail. Typically, transfer trip is required on multi-terminal lines.

<sup>3</sup> Power failure tripping may be required on load tie-line interconnections to facilitate restoration of customer load after a transmission line or area outage.

**Table 4. Basic Generator Protection Devices**

Generator Protection Device	Device Number	40 kW or Less	41 kW to 400 kW	401 kW and Larger
Phase Overcurrent	50/51	X <sup>1</sup>	X <sup>1</sup>	
Oversvoltage	59	X	X	X
Undersvoltage	27	X <sup>2</sup>	X	X
Overfrequency	81O	X	X	X
Underfrequency	81U	X	X	X
Ground Over Voltage (ground fault protection for ungrounded system at the Applicant's end)	59G	TBD	TBD	TBD
Synchronizing and Reclosing Relays	25	TBD	TBD	TBD
Ground Fault Sensing Scheme (Utility Grade)	51N		X <sup>3</sup>	X
Overcurrent With Voltage Restraint/Voltage Control or Impedance Relay	51V 21		X <sup>4</sup>	X
Reverse Power Relay (Self-Service)	32	X <sup>5</sup>	X <sup>5</sup>	X <sup>5</sup>
Out of Step	68	TBD	TBD	TBD

- <sup>1</sup> Overcurrent protection must be able to detect a line-end fault condition. A phase instantaneous overcurrent relay, which can see a line fault under sub-transient conditions, is required. This is not required if a 51V relay is used.
  - <sup>2</sup> For generators 40 kW or less, the undervoltage requirement can be met by the contactor undervoltage release.
  - <sup>3</sup> For induction generators and certified non-islanding inverters aggregating less than 100 kW, ground fault detection is not required. For synchronous generators aggregating over 40 kW, ground fault detection is required.
  - <sup>4</sup> A group of generators, each less than 400 kW but whose aggregate capacity is greater than 400 kW, must have an impedance relay or an overcurrent relay with voltage restraint located on each generator greater than 100 kW.
  - <sup>5</sup> For “Self-service” generator installations, under the proper system conditions, a set of three single-phase, very sensitive reverse power relays, along with the dedicated transformer may be used in lieu of ground fault protection. The relays shall be set to pick-up on transformer magnetizing current, and trip the main breaker within 0.5 second. Reverse Power (32) toward Otter Tail System where the Generator is not selling power to Otter Tail. Reverse Power (37-50 package) for faults on source line when low side can be looped.
- TBD = to be determined on a project-by-project basis

### **C. RELIABILITY AND REDUNDANCY**

The failure to trip during fault or abnormal system conditions due to relay or breaker hardware problems, or from incorrect relay settings, improper control wiring, etc. is always a possibility. The protection system must be designed with enough redundancy that failure of any one component still allows the Facility to be isolated from the Otter Tail Power Company system under a fault condition. Otter Tail may suggest or require back-up protection. If the Facility’s breaker does not trip, the incoming breaker should trip after a predetermined time delay. Similarly, if the incoming breaker fails to trip, the Facility’s breaker should trip. Where there is no incoming breaker, the Otter Tail tie breaker may be tripped.

### **D. LINE PROTECTION**

Line-protection relays must coordinate with the protective relays at the Otter Tail breakers for the line on which the Applicant’s Facility is connected. The typical protective zone is a two-terminal line section with a breaker on each end. In the simplest case of a load on a radial line, current can flow in one direction only, so protective relays need to be coordinated in one direction and do not need directional elements. However, on the typical transmission system, where current may flow in either direction depending on system conditions, relays must be directional. In addition, the complexity and the required number of protective devices increase dramatically with increases in the number of terminals in each protective zone. With two terminals in a protective zone, there are two paths of current flow. With three terminals, there are six paths of current flow, and so on.

In coordinating a multi-terminal scheme, Otter Tail may sometimes require installation of a transmission line protective relay at the Applicant’s substation site. This is commonly the case whenever three-terminal permissive overreach transfer trip (POTT) schemes or blocking schemes are employed to protect the line. Because this line relay participates in a scheme to protect the

Otter Tail transmission system, Otter Tail must ensure the maintenance, testing and reliability of this particular type of relay.

In addition, the breaker's relays must be set to have overlapping zones of protection in case a breaker within any given zone fails to clear. The line protection schemes must be able to distinguish between generation, inrush and fault currents. Multiple terminal lines become even more complex to protect. Existing relay schemes may have to be reset, replaced, or augmented with additional relays at the Applicant's expense, to coordinate with the Applicant's Facility.

The Otter Tail required relays must be located so that a fault on any phase of the Otter Tail line shall be detected. If transfer trip protection is required by Otter Tail, the Applicant shall provide at its expense a communications circuit. This circuit may be a communication line from the telephone company or a dedicated cable. In certain cases power line carrier, fiber optic cable, or microwave communication circuits are also acceptable. The line must have high-voltage protection equipment on the entrance cable so the transfer trip equipment will operate properly during fault conditions.

The Otter Tail transmission system and the distribution network system are designed for high reliability by having multiple sources and paths to supply customers. Due to the multiple sources and paths, more complex protection schemes are required to properly detect and isolate the faults. **The addition of any new interconnected facility to the Otter Tail system must not degrade the existing protection and control schemes or cause existing Otter Tail customers to suffer lower levels of safety and/or reliability.**

Tables 3 and 4 list the minimum protection that Otter Tail typically requires. Higher voltage interconnections require additional protection due to the greater potential for adverse impact to system stability and the greater number of customers who would be affected. Special cases such as distribution-level network interconnections, if acceptable, may have additional requirements. The acceptability and additional requirements of these interconnection proposals shall be determined by Otter Tail on a case-by-case basis.

## **E. FAULT-INTERRUPTING DEVICES**

The fault-interrupting device selected by the Applicant must be reviewed and approved by Otter Tail for each particular application.

There are three basic types of fault-interrupting devices:

- Circuit Breakers
- Circuit Switchers
- Fuses

Otter Tail will determine the type of fault-interrupting device required for a facility based on the available fault duty, the local circuit configuration, the size and type of generation, and the existing Otter Tail protection equipment.

## **1. Circuit Breakers**

Ownership of the intertie circuit breaker will be determined during the interconnection study. However, Otter Tail will have the operational authority to operate all intertie circuit breakers at all installations where the Applicant's generation has been classified as greater than 5 MW and for all substation or tie-line interconnections. Upgrading existing circuit breakers within or outside the area of the interconnection may be required due to the increased fault current levels. If this system modification is necessary, it may be at the Applicant's expense.

A three-phase circuit breaker at the point of interconnection automatically separates the Applicant's Facility from the Otter Tail system upon detection of a circuit fault. Additional breakers and protective relays may be installed in the Applicant's Facility for ease in operating and protecting the Facility, but they are not required for the purpose of interconnection. The interconnection breaker must have sufficient capacity to interrupt maximum available fault current at its location and be equipped with accessories to:

- Trip the breaker with an external trip signal supplied through a battery (shunt trip).
- Telemeter the breaker status when it is required.
- Lockout if operated by protective relays required for interconnection.

Generally, a three-phase circuit breaker is the required fault-interruption device at the point of interconnection, due to its simultaneous three-phase operation and ability to coordinate with Otter Tail line-side devices.

## **2. Circuit Switchers**

A circuit switcher is a three-phase fault-interrupter with limited fault interrupting capability. These devices have typically been used at voltages of 115 kV and below and may substitute for circuit breakers when the fault duty is within the interrupting rating of the circuit switcher. With Otter Tail approval, some circuit switchers with blades can double as the visual open disconnect switch between the metering transformers and the main transformer. Since circuit switchers do not have integral current transformers, they must be installed within 30 feet of the associated current transformers to minimize the length of the unprotected line/bus section.

## **3. Fuses**

Fuses are single-phase, direct-acting sacrificial links that melt to interrupt fault current and protect the equipment. Blown fuses need to be replaced manually after each fault before the Facility can return to service. Overhead primary fuses shall be replaced by trained, qualified personnel. Because fuses are single-phase devices, all of them may not melt during a fault and therefore would not automatically separate the interconnected

Facility from Otter Tail. Large primary fuses which do not coordinate with the Otter Tail substation breaker ground relays could cause all the customers on the circuit to lose power due to a fault inside the Applicant's interconnected Facility and therefore will not be allowed.

For load-only facilities, Otter Tail may approve the use of fuses if they coordinate with the Otter Tail line-side devices for both phase and ground faults. In limited cases, fuses may be used as a primary protective device (e.g. rural, 60 kV, 70 kV and 115 kV lines, where the Applicant's substation is 12 MW or less). However, if fuses are approved by Otter Tail, the Applicant should consider installing a negative sequence relay and/or other devices to protect its Facility against single-phase conditions.

For generation interconnections, fuses cannot be operated by the protective relays and therefore cannot be used as the primary protection for three-phase generation facilities. Fuses may be used for high-side transformer protection for generation less than 5 MW, provided coordination can be obtained with the existing Otter Tail phase and ground protection and if a separate generator breaker provides the required primary protection. Fuses are not permitted for high-side transformer protection for facilities of 5 MW or greater.

#### **F. SINGLE-PHASE DEVICES - FUSES/OIL CIRCUIT RECLOSERS**

It may be necessary to replace single-phase devices (line fuses, single-phase automatic circuit reclosers) installed between the Otter Tail source substation and the Applicant location with three-phase devices. This is to minimize the possibility of single-phasing an Applicant's three-phase generator. Single-phase sectionalizing equipment may be installed on the main circuit past the Applicant location, or on radial circuits that tap the main circuit between the source substation and the Applicant location.

Because the Applicant is responsible for protecting its equipment from the effects of excessive negative sequence currents, the Applicant must know if there are single-phase devices located between its Facility and the Otter Tail source substation.

#### **G. AUTOMATIC RECLOSING/VOLTAGE CHECK SCHEMES**

Otter Tail normally applies automatic reclosing to all transmission and overhead distribution lines. Prior to automatic reclosing, the Applicant must ensure that the Applicant's Facility is disconnected from Otter Tail. It may be necessary to install voltage check schemes at various locations on the Otter Tail System to prevent automatic reclosing in the event that an Applicant's Facility remains connected to an isolated, unfaulted section of the Otter Tail System. These voltage check schemes may be located at the interconnection point, at automatic circuit reclosers on the line feeding the Applicant, or on an Otter Tail source substation feeder breaker. These schemes may also be required on alternate circuits that may be used to feed the Applicant.

Details of any modifications to Otter Tail reclosing practices and/or addition of voltage check schemes will be determined during the interconnection study process.

**Otter Tail shall assume no responsibility for damage to Applicant's equipment due to out-of-phase reclosing.**

In general, reclosing practices should be as follows:

- There should be no automatic reclosing for the incoming breaker.
- The Otter Tail substation breaker may have one or more timed recloses, with the first set at a minimum of 2 seconds. It is expected that either the generator or the tie breaker will open before reclosing takes place.
- Where islanding is possible, the Otter Tail substation breaker may need the function of voltage supervision from the tie-line.

## **H. INSULATION COORDINATION**

Power system equipment is designed to withstand voltage stresses associated with expected operation. Adding or connecting new facilities can change equipment duty, and may require that equipment be replaced or switchgear, telecommunications, shielding, grounding and/or surge protection added to control voltage stress to acceptable levels. Interconnection studies may identify additional requirements to maintain an acceptable level of Otter Tail System availability, reliability, equipment insulation margins, and safety.

Voltage stresses, such as lightning or switching surges, and temporary overvoltages may affect equipment function. Remedies depend on the equipment capability and the type and magnitude of the stress. In general, stations with equipment operated at 15 kV and above, as well as all transformers and reactors, shall be protected against lightning and switching surges. Typically, this includes station shielding against direct lightning strokes, surge arresters on all wound devices, and shielding with rod gaps (or arresters) on the incoming lines. The following requirements may be necessary to meet the intent of Otter Tail's Reliability Criteria.

### **1. Surge Protection**

The interconnection shall have the capability to withstand voltage and current surges in accordance with the environments defined in IEEE/ANSI C62.41 and IEEE C37.90.1.

Otter Tail highly recommends the Applicant to install surge arresters for protection of transformers and other vulnerable equipment. Arresters shall be mounted in such a manner as to protect any of Otter Tail's facilities from surge voltages. In general, all OTP incoming lines shall be protected with surge arresters located on the line side of the disconnect switch. All lines connecting to an Otter Tail substation shall include either rod gaps or surge arresters for substation entrance protection. Otter Tail staff will

recommend the appropriate level of entrance protection as well as other specifications for surge arresters during the interconnection process.

## **2. Lightning Surges**

If the Requester proposes to tap a shielded transmission line, the tap line to the substation must also be shielded. For an unshielded transmission line, the tap line does not typically require shielding beyond that needed for substation entrance. However, special circumstances such as the length of the tap line may affect shielding requirements.

Lines at voltages of 69 kV and higher that terminate at Otter Tail substations must meet additional shielding and/or surge protection requirements. Incoming lines must be shielded for ½ mile at 69-150 kV and 1 mile at 230 kV and higher. Rod gaps must also be installed at the station entrance. For certain customer service substations at 230 kV and below, Otter Tail may require only an arrester at the station entrance in lieu of line shielding, or a reduced shielded zone adjacent to the station. These variations depend on the tap line length, the presence of a power circuit breaker on the transmission side of the transformer, and the size of the transformer. Such exceptions can be discussed with your Otter Tail representative.

## **3. Temporary Overvoltages**

Temporary overvoltages can last from seconds to minutes, and are not characterized as surges. These overvoltages are present during islanding, faults, loss of load, or long-line situations. All new and existing equipment must be capable of withstanding these duties.

### **a. Islanding**

A ‘local island’ condition can expose equipment to higher-than-normal voltages. Special relays to detect this condition and isolate the local generation from Otter Tail facilities may be required.

### **b. Neutral Shifts**

When generation or a source of ‘back-feed’ is connected to the low-voltage side of a delta-grounded wye customer service transformer, remote end breaker operations initiated by the detection of faults on the high-voltage side can cause overvoltages that can affect personnel safety and damage equipment. This type of overvoltage is commonly described as a neutral shift and can increase the voltage on the unfaulted phases to as high as 1.73 per unit. At this voltage, the equipment insulation withstand-duration can be very short. Several alternative remedies are possible:

- Provide an effectively grounded system on the high-voltage side of the transformer that is independent of other transmission system connections.
- Size the high-voltage-side equipment to withstand the amplitude and duration of the neutral shift.
- Rapidly separate the back-feed source from the step-up transformer by tripping a breaker using either remote relay detection with pilot scheme (transfer trip) or local relay detection of overvoltage condition.

Effectively grounded is defined as an  $X_0/X_1 \leq 3$  and  $R_0/X_1 \leq 1$ . Methods available to obtain an effective ground on the high-voltage side of the transformer include:

- A transformer with the transmission voltage (Otter Tail 's) side connected in a grounded-wye configuration and low voltage (Connection Point) side in closed delta.
- A three-winding transformer with a closed-delta tertiary winding. Both the transmission and distribution side windings are connected in grounded wye.
- Installation of a grounding transformer on the transmission voltage (Otter Tail ) side.

Any of these result in an effectively grounded system with little risk of damage to surge arresters and other connected equipment.

## **I. MAINTENANCE OF APPLICANT-OWNED INTERCONNECTION PROTECTIVE DEVICES**

Interconnection protective devices owned by the Applicant (as determined by the interconnection study process) should be maintained and inspected according to manufacturer recommendations and/or industry standards. Procedures must be established for visual and operational inspections. Additionally, provisions should be established for equipment maintenance and testing.

Equipment should include, but not be limited to:

- Circuit Breakers
- Protective Relays
- Control Batteries
- P-Ts, Fuses, Switches, SCADA Equipment
- Metering

Otter Tail maintains the right to review maintenance, calibration and operation data of all protective equipment for the purpose of protecting Otter Tail facilities and other Otter Tail customers. The Applicant is responsible for providing the necessary test accessories (such as

relay test plugs, instruction manuals, wiring diagrams, etc.) required to allow Otter Tail to test these protective devices. Verification may include the tripping of the intertie breaker.

If Otter Tail performs work on the Applicant's premises, an inspection of the work area may be made by Otter Tail operating personnel. If hazardous working conditions are detected, the Applicant will be required to correct the unsafe conditions before Otter Tail will perform the work.

## **J. COMMUNICATION CHANNEL**

Otter Tail may require that a communication channel and associated communication equipment be installed as part of the protective scheme. This channel may consist of power line carrier, leased telephone line, pilot wire circuit, fiber optic cable, radio, or other means. The communication channel is required in cases where it is necessary to remotely send a signal to remove the Applicant's Facility from the Otter Tail System due to a fault or other abnormal conditions that cannot be sensed by the protective devices at the Applicant's location. Some instances may require installation of communication equipment in Otter Tail substations to initiate the protective signals. Otter Tail shall be reimbursed by the Applicant for the cost of this equipment and its installation.

Another communication channel may be needed for monitoring and control purposes. Telemetry requirements are defined in Section III.J. and Appendix A. Specific communication channel requirements will be determined during the interconnection study process. The cost of installation and additional monthly fees for this channel will be the responsibility of the Applicant.

## **VI. REQUIREMENTS SPECIFIC TO GENERATION INTERCONNECTIONS**

For purposes of this handbook, generation is defined as any device producing (or releasing from storage) electrical energy. Such devices include rotating generators driven by steam turbines, internal combustion engines, or hydraulic turbines; windmills; photovoltaic arrays; fuel cells; battery arrays; or other energy sources with a DC to AC inverter or any other electric generating device. Parallel Operation is defined as the operation of Applicant-owned generation with output terminals connected directly or through an intermediary's system to Otter Tail's electric delivery system. Parallel Operation may be long-term or momentary ("make before break," "hot" or "closed-transition transfer").

Identified within this section are general requirements that apply to generating equipment operated in long term parallel with the Otter Tail System including three-phase and single-phase generators or inverter installations. Some requirements are dependent upon the size of the installation as will be noted in the requirements. Additionally, the requirements to interconnect generation may vary depending upon:

- Whether the interconnection transfer is open or closed.
- The Otter Tail system interconnection voltage.
- Interconnection power flow (one-way or two-way).
- The size, type, or location of the proposed interconnection.
- The scheduling of energy within Otter Tail’s Control Area.

**A. THE MANNER IN WHICH THE INSTALLATION WILL OPERATE (PARALLEL VS. ISOLATED) INCLUDING THE TRANSITION METHODS**

Operating procedures and equipment installation will determine the type of transition scheme implemented. The method of transition implemented will be dependant upon the Applicant’s desired terms and conditions of rates and tariffs associated with transactions and/or alternatively, the Applicant’s desired method of transition will determine the terms and conditions of rates and tariffs. These conditions can be discussed between the Applicant and their Otter Tail project representative. For any installation, improper operation will result in action by Otter Tail to remove such hazard in order to safeguard its employees.

The possible transition operating schemes are listed below.

**1. Isolated**

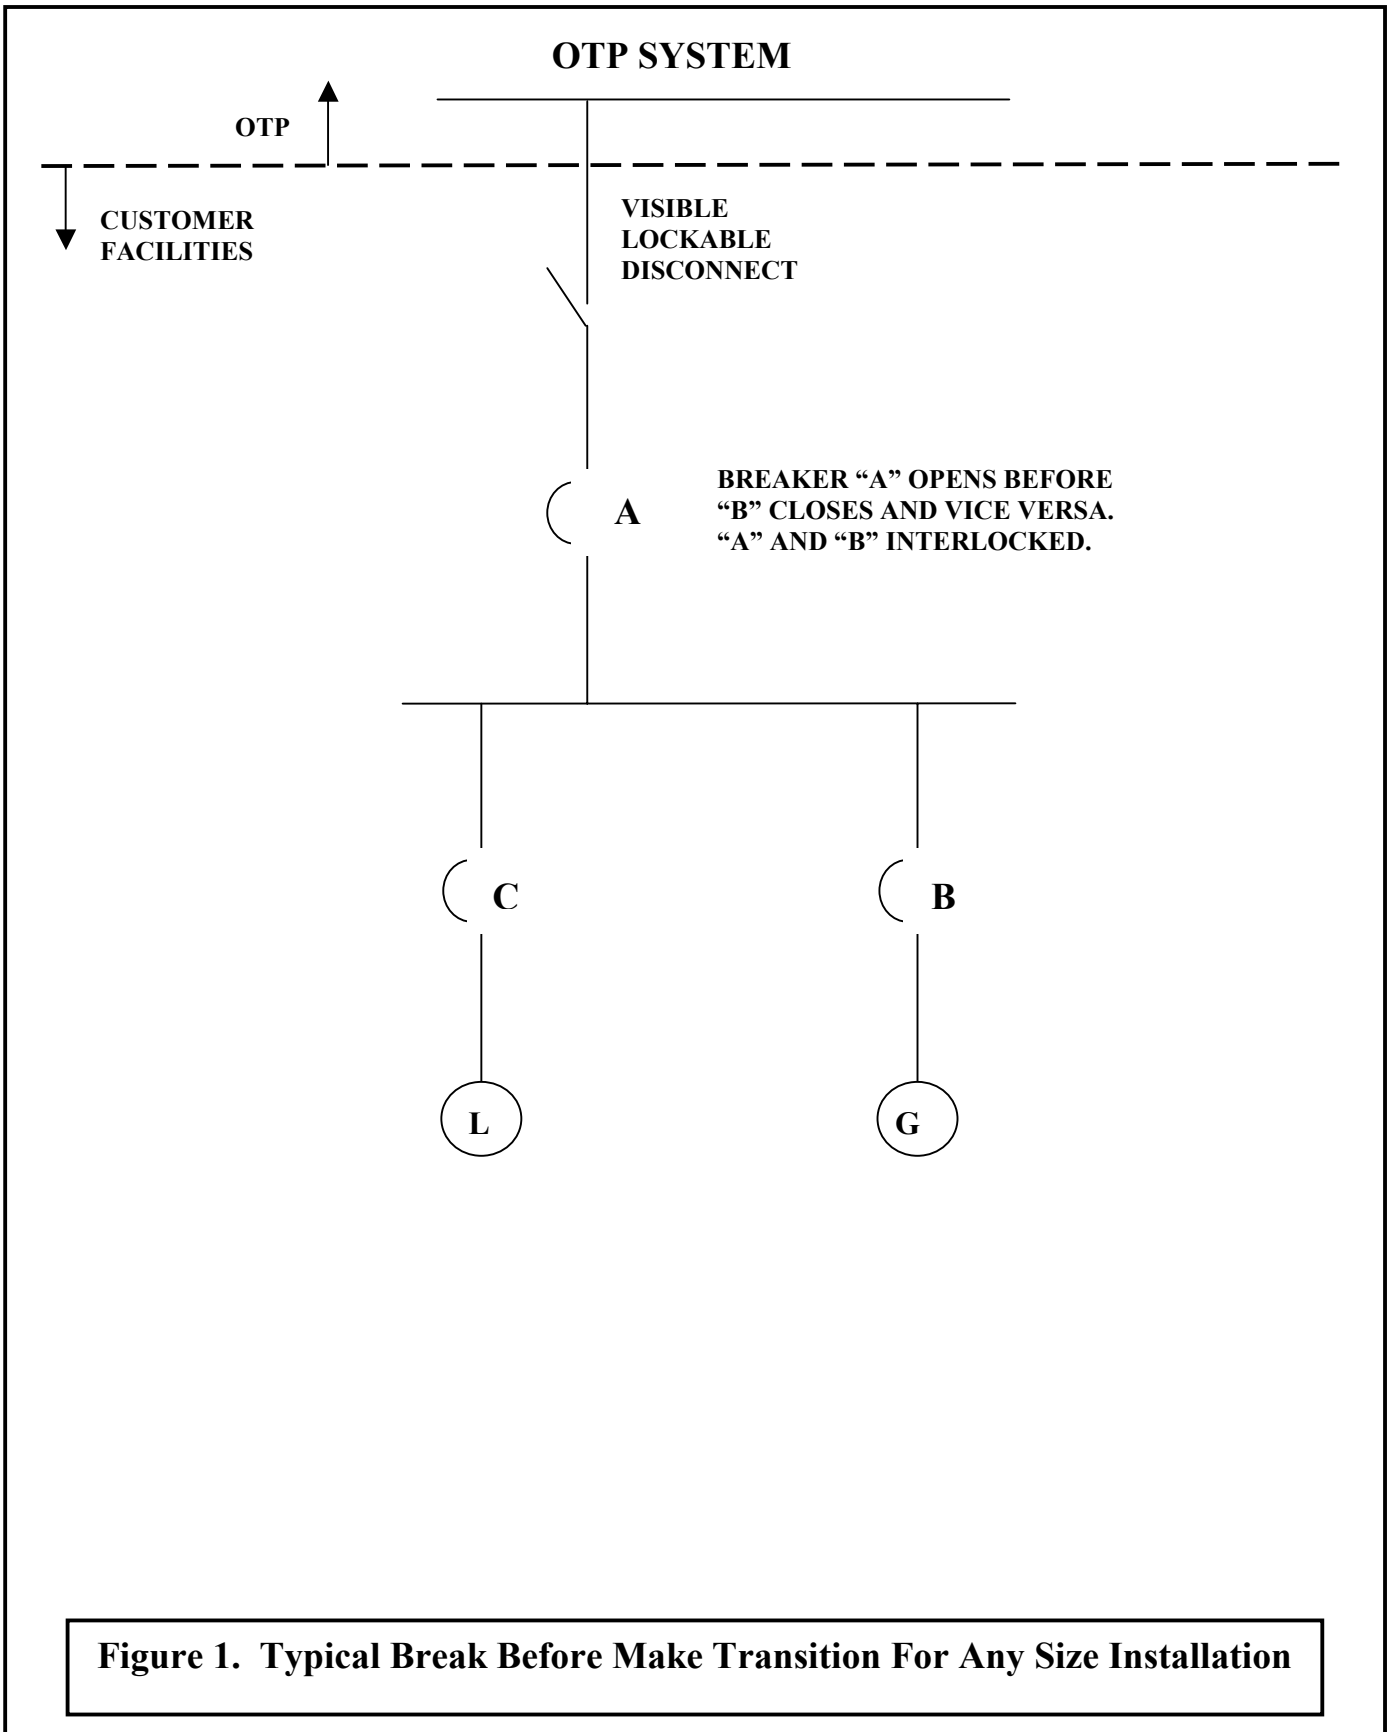

An isolated scheme (Figure 1) is achieved by operating in a Break Before Make switching scheme. This operation requires that the load will lose voltage before the generating unit is connected to the load. The generating unit will supply all of the needs of the connected load.

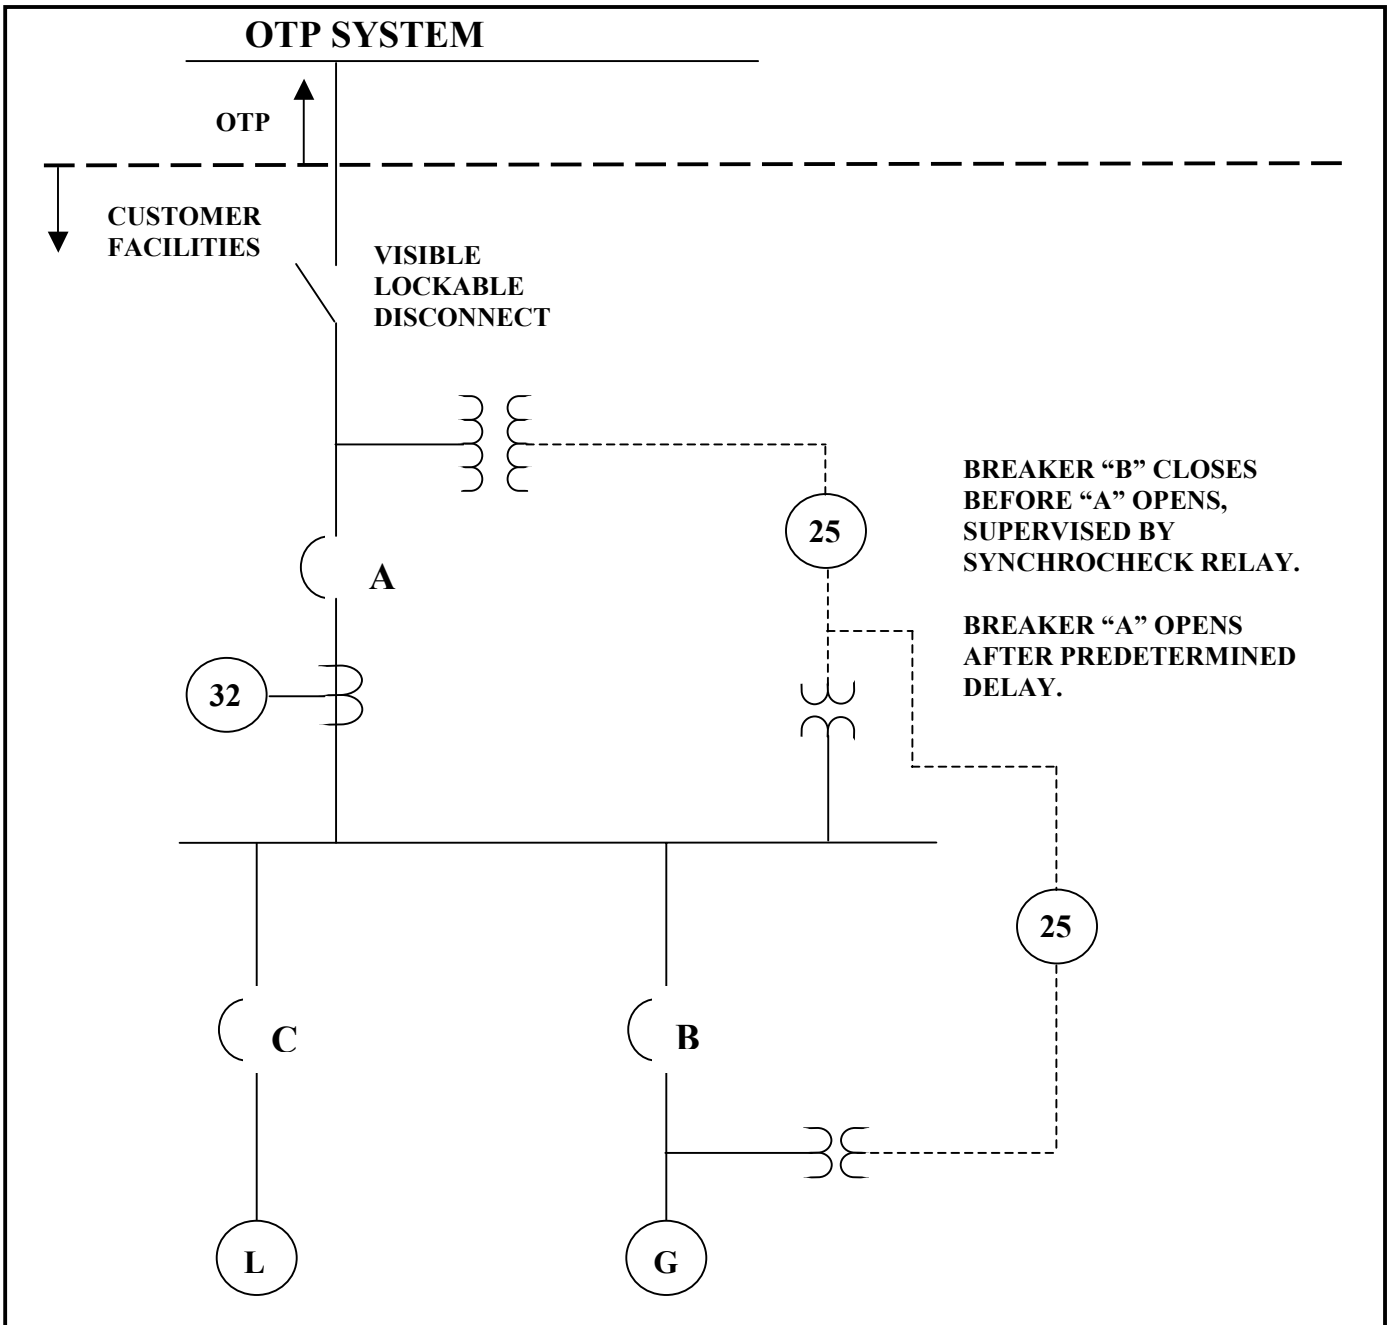

**2. Closed Momentary Parallel**

A closed momentary parallel operating scheme (Figure 2) operates in a Synchronized Make Before Break switching scheme. With this operation no loss of voltage to the connected load occurs. The momentary closed operation puts the generating unit in parallel with Otter Tail’s transmission system for a short time (usually less than 30 cycles.) The generating unit will supply all of the needs of the connected load.

**3. Closed Continuously Parallel**

This scheme is accomplished by operating in a Synchronized Make switching scheme (Figures 3 and 4). The generating unit operates continuously in parallel with Otter Tail’s System. The generating unit can supply all or part of the connected load or supply capacity and energy to wholesale customers on the regional transmission grid. Closed Continuously Parallel generating units require separate generation metering.

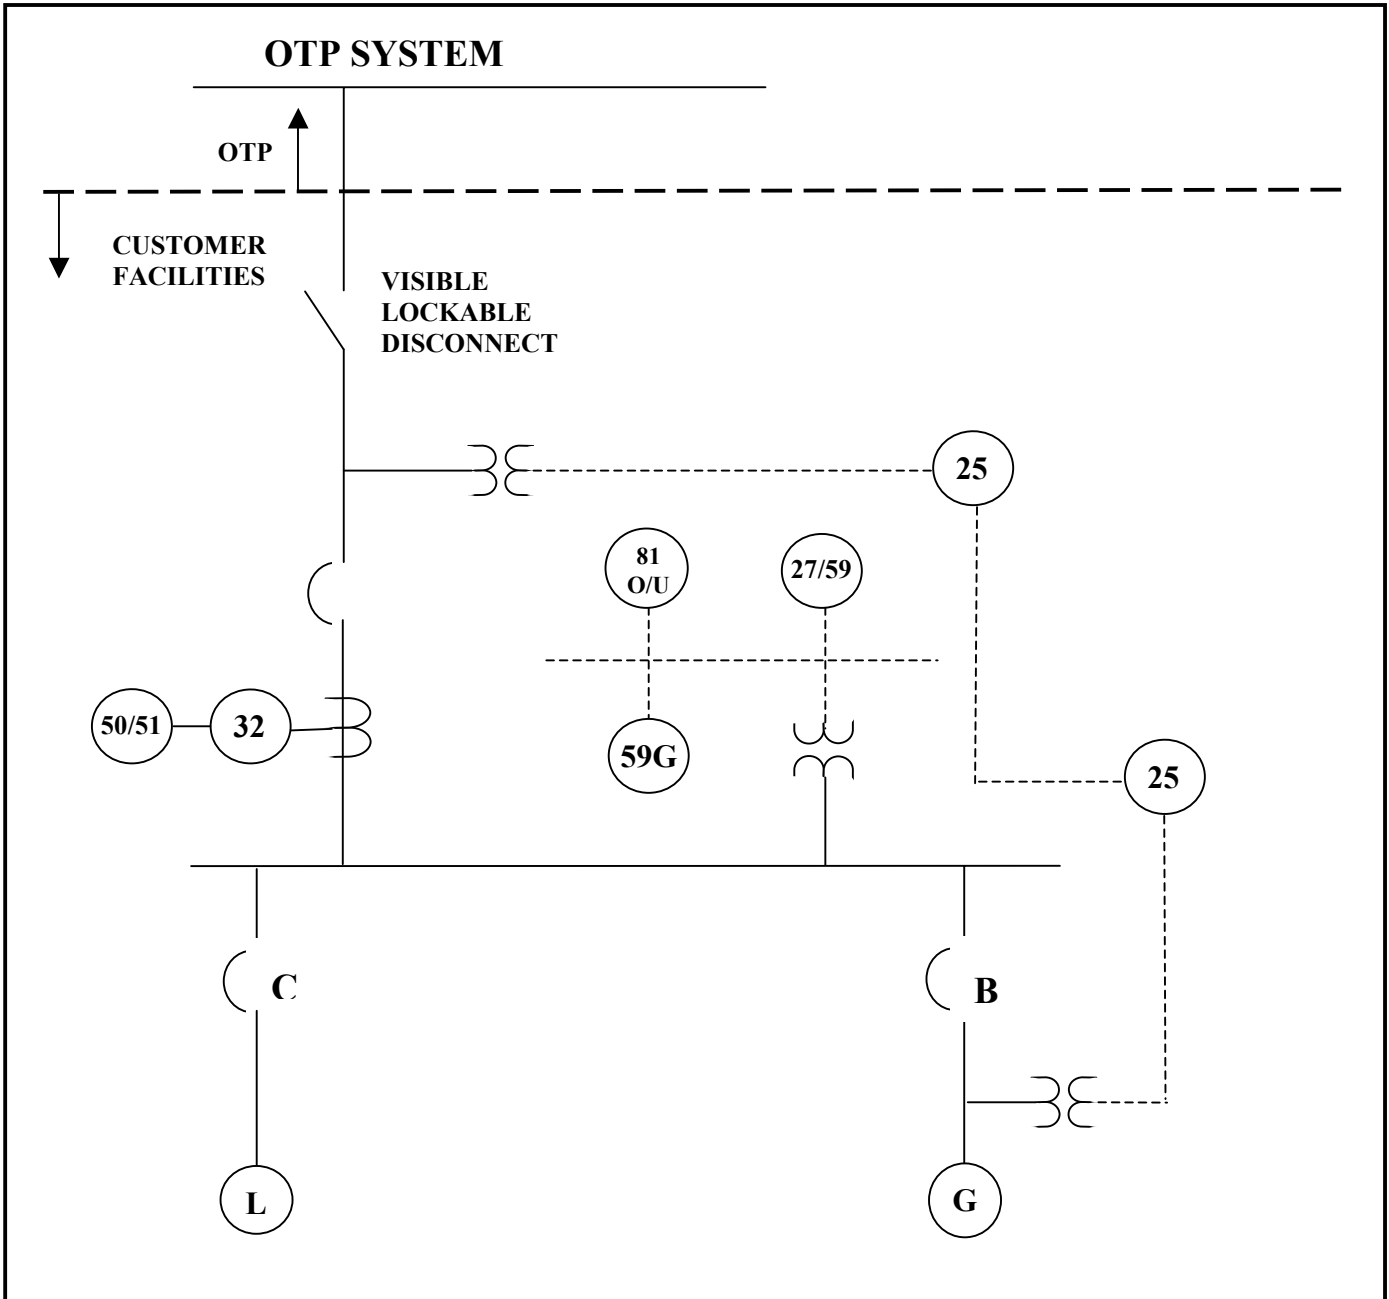

**BREAKER "B" CLOSSES BEFORE "A" OPENS, SUPERVISED BY SYNCHROCHECK RELAY.**

**BREAKER "A" OPENS AFTER PREDETERMINED DELAY.**

**PROTECTIVE DEVICES**

25 – SYNCHECK RELAY (Syncheck on breaker "A" prevents closing for deenergized Otter Tail System)  
 32 – REVERSE POWER RELAY

**Figure 2. Typical Make Before Break Transition – Not Intended For Continuous Operation**

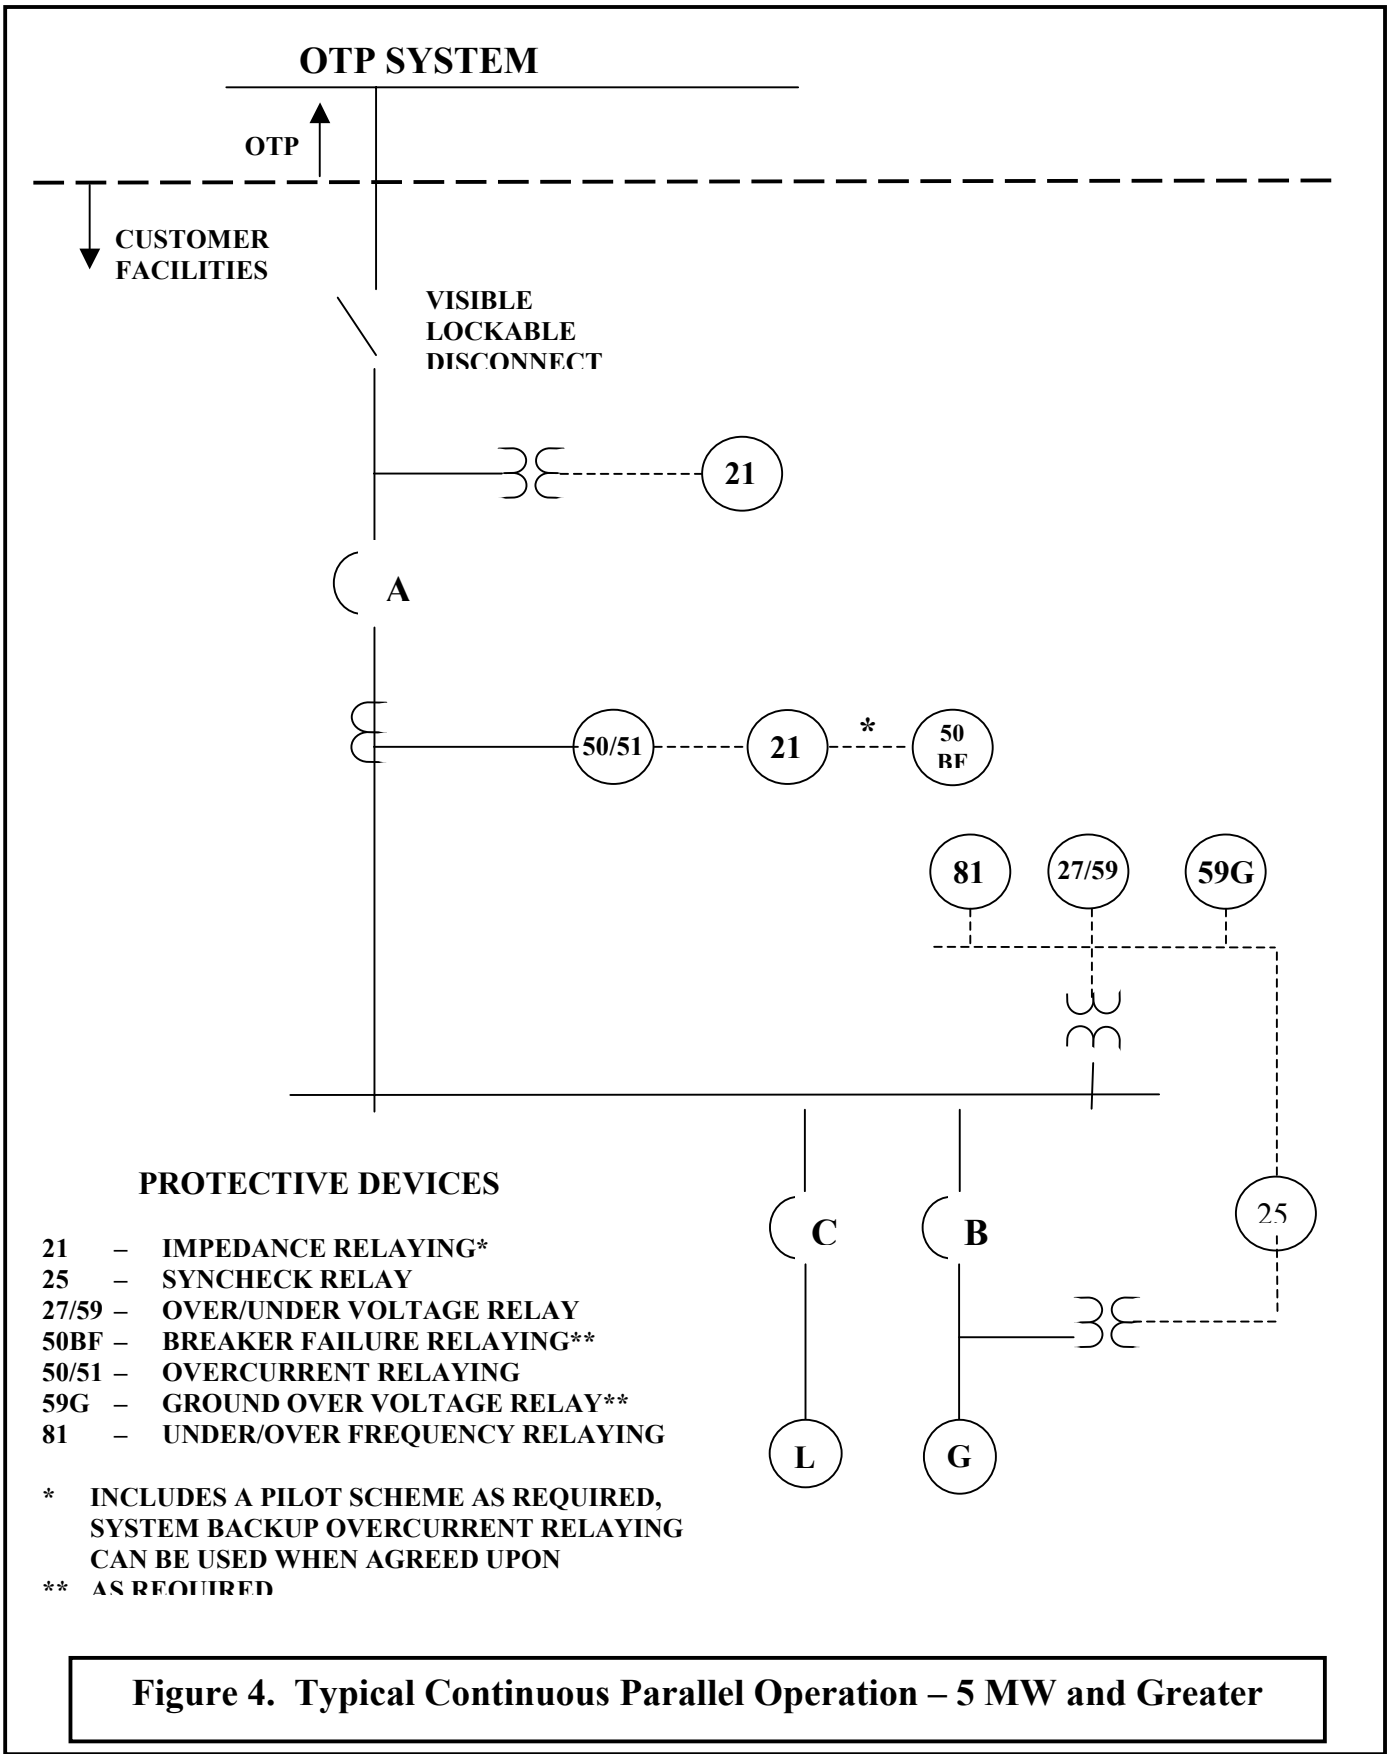

**PROTECTIVE DEVICES**

- 25 - SYNCHECK RELAY
- 27/59 - OVER/UNDER VOLTAGE RELAY
- 32 - REVERSE POWER RELAY
- 50/51 - OVERCURRENT RELAYING
- 59G - GROUND OVER VOLTAGE (FOR UNGROUNDED SYSTEMS)
- 81 O/U - OVER/UNDER FREQUENCY RELAYING

**Figure 3. Typical Continuous Parallel Operation for Less Than 5 MW**

## **B. GENERATOR CLASSIFICATIONS**

For the purpose of this document, Applicant-owned generators are classified as either “Self-service” or “Wholesale” generators.

### **1. Self-service Generators**

Self-service generators (Isolated, Closed Momentary Parallel, or Closed Continuously Parallel) are those whose purpose is to serve only on-site customer loads and not to deliver power over Otter Tail’s or other utilities’ electric facilities. At a minimum, these installations must demonstrate to Otter Tail’s satisfaction their compliance with the Otter Tail design standards.

### **2. Wholesale Generators**

Wholesale generators (Closed Continuously Parallel) are those units where the Applicant plans to sell power and/or energy to others or deliver such power over Otter Tail’s or another utility’s facilities (wheeling). In order for the generator to sell capacity, the generator must be reviewed and approved by MISO and/or the Applicable Reliability Council. Wholesale Generator installations may also be required to receive MISO or Applicable Reliability Council accreditation.

## **C. REQUIREMENTS FOR ACCREDITATION**

### **1. Initial Accreditation**

Plant Accreditation is the level of capacity a user of the Facility can count toward its load and capacity reserve obligations. The generating Applicant may first ask for temporary accreditation. After all the testing requirements have been met and the unit has proven to be reliable, final accreditation can be requested. The specific procedures and requirements can be obtained from an Otter Tail representative. Otter Tail will work with the Applicant in obtaining such accreditation.

### **2. Fuel Availability Requirements For Accreditation**

The generator must be normally capable of running over the 4 peak hours of a day for 5 days in succession. This includes having sufficient fuel available to meet this requirement.

### **3. URGE Testing Requirement**

The Wholesale Generation Applicant must agree to annually perform an URGE (Uniform Rating of Generating Equipment) test of each generator as required by the Applicable Reliability Council and/or MISO. This is typically a one to four hour test run of the generator for recording specific load and output data. This test can be conducted during a

time when the generator is normally run. The specific testing requirements depend on the type of prime mover for the Facility. Otter Tail will provide the specific test procedures for the unit upon receipt of the Application.

#### **4. Pool Emergency Requirement**

The generation Applicant must agree to make its generation available for call by Otter Tail for MISO emergencies. Unless the generator is out for maintenance or due to mechanical failure, the Applicant must be able to bring the unit to full output within 6 hours of a declaration by Otter Tail of a MISO emergency. This capability must be available throughout the Season in which the unit is planned to operate. *This requirement is not required for installations less than 100 KW.*

#### **5. Extended Outage for Equipment Failure or Significant Equipment Modifications**

There are reporting requirements for extended outages of generating equipment. If the outage is expected to last more than 120 days, contact an Otter Tail representative.

### **D. MODELING REQUIREMENTS FOR GENERATION GREATER THAN 5 MW**

All generator/exciter/governor manufacturer data sheets must be available for modeling in transient/voltage stability, short circuit, and relay setting calculation programs. This includes generator reactive capability curves and exciter saturation curves.

### **E. GENERATION RESERVES**

The control area is required to carry generation reserves including regulating reserves, contingency spinning reserves and contingency non-spinning reserves. Reserves are the obligation of the Interconnection Operator or the obligation may be assumed by the purchasing entity. Reserves may be provided by the Applicant, some other generator via contract, or by purchasing the reserves from a separate entity. A portion of those reserves must be maintained as spinning reserves. In any case, Otter Tail must approve reserve arrangements for a generation resource in the Otter Tail Control Area.

### **F. ISOLATION POWER TRANSFORMER**

To provide maximum operating flexibility for the Applicant's generation and to minimize possible adverse effects on other Otter Tail customers, a power transformer may be required between the Applicant's generator and Otter Tail-owned equipment. This transformer is usually connected to isolate the zero sequence circuit of the Applicant from the zero sequence circuit of the Otter Tail System. During the interconnection study process the required transformer

connection and grounding configuration will be determined, as well as whether or not a dedicated Otter Tail-owned transformer will be required to serve an Applicant with generation. Upgrading of Otter Tail transformer insulation levels and lightning arrester ratings to a higher voltage may be required at the Applicant's expense due to the addition of Applicant's generation. This is required for all sizes. For units less than 1 MW, the transformer that provides isolation is likely to be the same one already serving customer load. For those units 1 MW or greater, it is likely a dedicated transformer is added as part of the new unit.

#### **G. GENERATOR STEP-UP TRANSFORMER**

The available voltage taps of the Applicant's step-up transformer must be reviewed by Otter Tail for its suitability with the Otter Tail System. The Applicant is expected to request this review before acquiring the transformer. Otter Tail shall determine which voltage taps would be suitable for a step-up transformer for the Applicant's proposed project. Suitable taps are required to give the transformer the essential capacity for the generator to:

- Deliver maximum reactive power to Otter Tail's System at the Point of Interconnection (generator operating at 90 percent lagging power factor).
- Absorb maximum reactive power from Otter Tail's System (generator operating at 90 percent leading power factor).
- The Generation Entity's transformer, with correct voltage taps, helps maintain a specified voltage profile on Otter Tail's system for varying operating conditions. Actual voltage tap settings can be different for transformers connected at the same voltage level, depending upon their geographic location.

#### **H. AUTOMATIC GENERATOR CONTROL – 50 MW AND LARGER**

To comply with NERC Control Performance Criteria, the Applicant generator shall be equipped with Automatic Generator Control ("AGC") equipment to permit remote control and enable the generation to be increased or decreased via Automatic Generation Control. This requirement does not apply if the plant is exempt under NERC, MISO, or Applicable Reliability Council rules due to prime mover or regulatory limitations. Any remote control that is required will be implemented through the telemetry equipment identified in Section III.J. Certain additional interface signals will be required to implement the remote control.

#### **I. SYNCHRONIZATION OF APPLICANT'S GENERATION**

All Applicants, independent of generator size classification, are responsible for synchronization of Applicant's generation to the Otter Tail System. Before synchronization to the Otter Tail System will be permitted, all required studies, tests and inspections, and contracts must be completed and approved.

## VII. ADDITIONAL PROTECTION FOR GENERATION INTERCONNECTIONS

The generating unit must meet all applicable American National Standards Institute (ANSI) and Institute of Electrical and Electronic Engineers (IEEE) standards. The prime mover and the generator should be able to operate within the full range of voltage and frequency excursions that may exist on the Otter Tail system without damage to the unit.

### A. SYNCHRONIZING RELAYS

Synchronous generators and other generators with stand-alone capability must use one of the following methods to synchronize with the Otter Tail system:

- Automatic synchronization with **automatic synchronizing relay** (Device 25) to synchronize with the Otter Tail system. The automatic synchronizing relay must have all of the following characteristics:
  - Slip frequency matching window of 0.1 Hz or less.
  - Voltage matching window of  $\pm 10$  percent or less.
  - Phase angle acceptance window of  $\pm 10$  degrees or less.
  - Breaker closure time compensation.

Note: The automatic synchronizing relay sends a close signal to the breaker after the above conditions are met.

- Automatic synchronization with **automatic synchronizer** (Device 15/25) to synchronize with the Otter Tail system. The automatic synchronizer must have all of the following characteristics:
  - Slip frequency matching window of 0.1 Hz or less.
  - Voltage matching window of  $\pm 10$  percent or less.
  - Phase angle acceptance window of  $\pm 10$  degrees or less.
  - Breaker closure time compensation. For an automatic synchronizer that does not have this feature, a tighter frequency window ( $\pm 5$  degrees) with a one-second time acceptance window shall be used to achieve synchronization within  $\pm 10$  degrees phase angle.

Note: The automatic synchronizer has the ability to adjust generator voltage and frequency automatically to match system voltage and frequency, in addition to having the above characteristics.

- Manual synchronization with synchroscope and synch-check relay (Device 25) supervision. The synch-check relay must have the following characteristics:
  - Voltage matching window of  $\pm 10$  percent or less.
  - Phase angle acceptance window of  $\pm 10$  degrees or less.

Generators with greater than 1,000 kW aggregate nameplate rating must have automatic synchronizing relay or automatic synchronizer.

**B. FREQUENCY/SPEED CONTROL**

**1. 10 MW or Less**

All Applicant generating equipment shall be designed to operate between 59.5 and 60.5 hertz. The operating frequency of the Applicant's generating equipment shall not deviate more than 0.5 hertz from a 60-hertz base.

For the detection of an island condition, generators must have a means of automatically disconnecting from the Otter Tail System within 0.2 seconds if the frequency cannot be maintained within 0.5 hertz.

In the case where the generator is connected in parallel and provides Regulation Service, the Applicant shall adhere to the Frequency Control requirements for units larger than 10 MW, as detailed below.

**2. 10MW or Greater**

The Applicant will operate its generator consistent with Otter Tail guidelines and requirements concerning frequency control. Generators shall be equipped with governors that sense frequency (unless exempt under NERC, MISO, or Applicable Reliability Council rules due to prime mover or regulatory limitations).

- a. Governors shall provide a zero to ten percent (0-10%) adjustable setting nominally set at a five percent (5%) droop characteristic and a  $\pm 0.036$  hertz or less dead band unless otherwise agreed to by Otter Tail.
  - o The generator must begin increasing or decreasing capability at frequency set points of 59.964 hertz or 60.036 hertz respectively.
  - o The change in capability must begin occurring within 0.5 seconds of a detected frequency disturbance.
- b. Governors shall be maintained and tested in accordance with the manufacturer's specifications to maintain the performance stated in this section. The Applicant shall, at its sole expense, be responsible for this maintenance and testing.
- c. Applicant generating equipment must have short-term capability for non-islanded low frequency operation not less than the following:
  - o 60.0 – 59.5 hertz      continuous
  - o 59.5 – 59.3 hertz      10 minutes
  - o 59.3 – 58.7 hertz      10 seconds

Frequency relays must not constrain the operation of the generating facility to less than these values, unless agreed to by Otter Tail and coordinated with Otter Tail and the Applicable Reliability Council or MISO Under-Frequency Load Shed Plan. To ensure "ride-through" capability of the Otter Tail System, the Applicant shall implement an under-frequency relay set point for the Facility no greater than 58.5 Hz. Interconnected generating facilities receiving power from Otter Tail's System may implement a higher under-frequency relay set point if necessary to protect their facilities and equipment.

- d. Unless Otter Tail agrees otherwise, if the generator is operated in parallel with Otter Tail's Distribution System, the generator will provide appropriate relaying to detect an island condition and provide a means to automatically disconnect from the Otter Tail system within 0.2 seconds if the frequency cannot be maintained within 0.5 hertz.
- e. Frequency control when communications with the System Operations Control Center has been lost; the Constant Frequency Operating Guide (below) shows the operation expected from all plant operators during major frequency excursions. The operator will respond following this guide to the maximum ability of the Applicant's generating equipment.

Figure 2. Constant Frequency Operating Guide

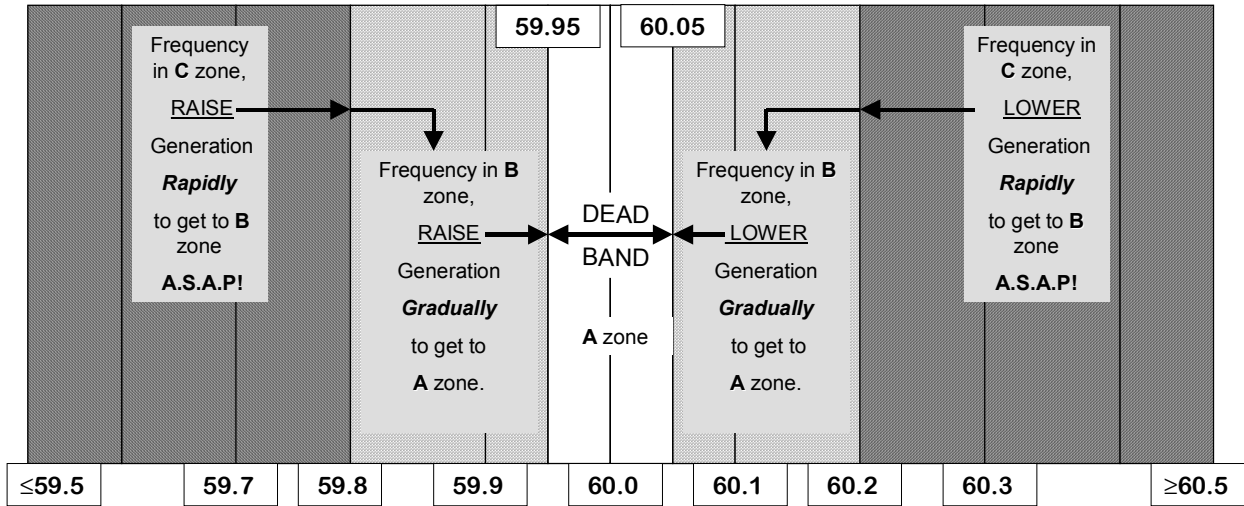

**Constant Frequency Operating Guide**

1. Use this guide *only* when AGC and all voice communications with System Control have been lost.
2. When frequency is in C zone, manually load/unload unit as soon as possible.
3. When frequency is in B zone, manually load/unload unit in gradual increments to avoid overcorrecting.
4. When frequency is in A zone, let governor action control unit output.
5. Raise or lower kV set point no more than ± 5% of schedule if necessary in order to increase MW capability.
6. In situations of severe under/over speed or severe under/over voltage,

Freq. (Hz)	Shaft Speed (RPM)		
	2-poles	4-poles	-poles
59.80	3588	1794.0	
59.90	3594	1797.0	
59.95	3597	1798.5	
60.00	3600	1800.0	
60.05	3603	1801.5	
60.10	3606	1803.0	
60.20	3612	1806.0	

Frequency = 1/2 (no. of poles) x (RPM/60)

**TAKE STANDARD PRECAUTIONS TO PROTECT YOUR UNIT!**

**C. EXCITATION SYSTEM REQUIREMENTS**

An excitation system is required to regulate generator output voltage.

- Static systems shall have a minimum ceiling voltage of 150 percent of rated full load field voltage with 70 percent of generator terminal voltage and a maximum response time of two cycles (0.033 seconds).
- Rotating systems shall have an ANSI voltage response ratio of 2.0 or faster.
- Excitation systems shall respond to system disturbances equally in both the buck and boost directions.

Under certain conditions, Otter Tail may grant an exemption for generation facilities that have excitation systems not meeting these requirements. These requests may be addressed during the interconnection study process.

#### **D. POWER SYSTEM STABILIZER (PSS)**

Generators with properly tuned and calibrated PSSs provide damping to electric power oscillations. Such damping improves stability in the electrical system and may prevent an individual generator from unnecessary tripping. To comply with the Applicable Reliability Council requirements, generators 75 MW or larger must be equipped with Power System Stabilizers to dampen power oscillations. The Power System Stabilizer is to be tuned to the Otter Tail System mode of oscillation.

#### **E. EVENT RECORDER**

All unattended generation facilities with capability greater than 1 MW and with automatic or remotely initialed paralleling capability must have an event recorder that will enable Otter Tail to make an after-the-fact determination of the status of the generation facility at the time of a system disturbance, should such determination be required. The generation facility operator shall ensure that such time reading is correct and synchronized to an accurate time standard. The event recorder or other recording device(s) at the generation facility must be capable of providing a record of (1) the time of any relay operations and targets of the relay that caused the generation facility to separate, if applicable, (2) the time of any paralleling with and separations from the Otter Tail system and (3) the time of the change in voltage-control device set points (if applicable) and (4) the time of change in the operating status (i.e., opened or closed) of any other voltage-control device (i.e., shunt capacitors or reactors). In addition, for generation facilities with a nameplate rating equal to or greater than 10 MW, the event recorder must also provide a record of deliveries to Otter Tail Power Company of real power in kW and reactive power in kVAr and output voltage in kV.

### **VIII. SUBSTATION GROUNDING**

Each Generation Site and/or Interconnecting Substation must have a ground grid that solidly grounds all metallic structures and other non-energized metallic equipment. This grid shall limit the ground potential gradients to such voltage and current levels that will not endanger the safety of people or damage equipment which are in, or immediately adjacent to, the station under normal and fault conditions. The size, type and ground grid requirements are in part based on local soil conditions and available electrical fault current magnitudes. In areas where ground grid voltage rises are not within acceptable and safe limits (due for example to high soil resistivity or limited substation space), grounding rods and wells can be used to reduce the ground grid resistance to acceptable levels.

If the Generation Site is close to another substation, the two ground grids may be isolated or connected. If the ground grids are to be isolated, there may be no metallic ground connections between the two substation ground grids. Cable shields, cable sheaths, station service ground sheaths, and overhead transmission shield wires can all inadvertently connect ground grids. Fiber-optic cables are an excellent choice for telecommunications and control between two

substations to maintain isolated ground grids. If the ground grids are to be interconnected, the interconnecting cables must have sufficient capacity to handle fault currents and control ground grid voltage rises. Otter Tail must approve any connection to an Otter Tail substation ground grid.

The interconnection of lines and/or generation may substantially increase fault current levels at nearby substations. Modifications to the ground grids of existing substations may be necessary to keep grid voltage rises within safe levels. The Interconnection Study will determine if modifications are required and the estimated cost.

The Reference section of this document supplies a list of ANSI/IEEE technical resources for grounding.

## **IX. PRE-PARALLEL CONTRACT REQUIREMENTS**

Prior to the actual operation of Applicant-owned facilities interconnected with the Otter Tail System, all equipment modifications must be complete and applicable contracts signed. Applicants will be required to sign the “Interconnection and Operating Agreement.” All facilities or entities scheduling within, in, or out of the Otter Tail’s Control Area are required to sign a Control Area Services and Operations Tariff. The CASOT addresses such things as scheduling, system control, and dispatch service; reactive supply and voltage control from generation sources; operating reserves; load regulation and frequency response; generator regulation and frequency response; load following; load imbalance; generator imbalance; generator backup supply; dynamic scheduling and short-interval scheduling. The Applicant must enter into a Control Area Services and Operations Tariff with the Company no later than 60 days prior to synchronization.

## **X. PRE-PARALLEL INSPECTION REQUIREMENTS**

The Applicant must have the interconnection installation inspected and certified by a qualified technician for proper installation and operation of the interconnection protective devices. The inspection shall include, *but not be limited to*:

- Verification that the installation is in accordance with the study results from the interconnection study process.
- Verification of the proper operation of the protective schemes.
- Verification that the proper voltages and currents are applied to the interconnection protective relays.
- Verification of proper operation and settings of the interconnection protective relays.
- Verification of synchronizing equipment.
- Trip testing of the breaker(s) tripped by the interconnection relays.

Otter Tail may, at its option, witness the inspection. The Applicant must give Otter Tail not less than seventy-two (72) hours prior written notice of upcoming tests. The certification and test report will be furnished to both the Applicant and Otter Tail as soon as practical.

Upon performance and certification of the pre-parallel inspection and execution of appropriate contracts/agreements, the Applicant shall be granted approval for operation of the interconnection facility and equipment in parallel with the Otter Tail System. Neither the inspection nor the granting of approval to the Applicant shall serve to relieve the Applicant of any liability for injury, death or damage attributable to the negligence of the Applicant. The inspection and approval does not constitute a warranty or relieve the Applicant of responsibility for the operating condition or installation of the equipment and may not be relied upon by the Applicant for that purpose.

Once the Facility is interconnected, Otter Tail will retain the right to inspect the Facility if the operation is suspected of causing problems for other Otter Tail customers, and Otter Tail retains the right to inspect at its discretion.

## **XI. OPERATING GUIDELINES**

The Applicant shall operate its equipment within the guidelines of this Handbook and any special requirements set forth by executed agreements. Where there is conflict or inconsistency with the terms of the agreement(s) and this Handbook, the terms in the agreement(s) shall apply.

Otter Tail reserves the right to open the intertie circuit breaker or disconnect device for any of the following reasons:

- Otter Tail is performing hot line maintenance work on the Otter Tail System.
- Otter Tail System Emergency.
- Inspection of the Applicant's equipment and protective equipment reveals a hazardous condition.
- Failure of the Applicant to provide maintenance and testing reports when required.
- The Applicant's equipment interferes with other customers or with the operation of the Otter Tail System.
- The Applicant has modified the equipment or protective devices without the knowledge or approval of Otter Tail.
- Operation, by Applicant, of any unapproved interconnected equipment.
- Personnel safety is threatened.
- Failure of the Applicant to comply with applicable OSHA Safety Tagging and Lockout requirements as well as MISO, Applicable Reliability Council, and Otter Tail switching guides and safety standards or any successor agency assuming or charged with similar responsibilities.

The failure of Otter Tail to open the intertie circuit breaker or disconnect device shall not serve to relieve the Applicant of any liability for injury, death or damage attributable to the negligence of the Applicant.

Changes to the Otter Tail System, or the addition of other customers with generation in the vicinity, may require modifications to the interconnection protective devices. If such changes are required, the Applicant may be subject to future charges for these modifications.

## XII. GLOSSARY

**Accredited:** Generating capability recognized as meeting MISO's and/or Applicable Reliability Council's requirements to satisfy a portion of its member's generating capacity obligation.

**Alternating Current (AC):** That form of electric current that alternates or changes in magnitude and polarity (direction) in what is normally a regular pattern for a given time period called frequency.

**Ampere (AMP):** The unit of current flow of electricity. It is to electricity as the number of gallons per minute is to the flow of water. One ampere flow of current is equal to one coulomb per second flow.

**Apparent Power:** For single phase, the current in amperes multiplied by the volts equals the apparent power in volt-amperes. This term is used for alternating current circuits because the current flow is not always in phase with the voltage; hence, amperes multiplied by volts does not necessarily give the true power or watts. Apparent power for three-phase equals the phase to neutral volts multiplied by ampere multiplied by 3.

**Applicable Reliability Council:** The regional reliability council of NERC, or its successor, in which the Facility is located.

**Automatic:** Self-acting, operated by its own mechanism when actuated by some impersonal influence as, for example, a change in current strength; not manual; without personal intervention.

**Automatic Reclosing:** A circuit breaker has automatic reclosing when means are provided for closing without manual intervention after it has tripped under abnormal conditions.

**Automatic Tripping (Automatic Opening; Automatic Disconnecting):** The opening of a circuit breaker under predetermined conditions without the intervention of an operator.

**Balanced Load:** An equal distribution of current on all phases of an AC circuit.

**Capacity:** The number of amperes of electric current a wire will carry without becoming unduly heated; the capacity of a machine, apparatus or device, is the maximum of which it is capable under existing service conditions; the load for which a transformer, transmission circuit, apparatus, station or system is rated; for a generator, turbine, the URGE rating.

**Circuit:** A conducting path through which an electric current is intended to flow.

**Circuit Breaker:** A device for interrupting a circuit between separable contacts under normal or fault conditions.

**Closed Momentary Parallel Transition:** In this scheme, an Applicant's source of power is transferred from Source 1 to Source 2 and vice-versa by momentarily connecting the two sources together. The Applicant's load is not interrupted during the transfer process.

**Closed Continuously Parallel Transition:** In this scheme, an Applicant's source of power is supplied from the utility grid and from the local generation source. The Applicant's load is not interrupted if the local generation source is not available.

**Control Area:** A control area is an electrical system bound by interconnect (tie- line) metering and telemetry and regulating its generation in order to maintain its interchange schedule with other systems, contributes to frequency regulation of the Interconnection and fulfills its obligations and responsibilities in accordance with NERC and reliability region requirements.

**Control Area Load:** Control area load is the entire demand for energy within a specified control area.

**Cogeneration:** The concurrent production of electricity and heat, steam or useful work from the same fuel source.

**Current:** A flow of electric charge measured in amperes.

**Current Transformer (CT):** A transformer intended for metering, protective or control purposes, which is designed to have its primary winding connected in series with a circuit carrying the current to be measured or controlled. A current transformer normally steps down current values to safer levels. A CT secondary circuit must never be open-circuited while energized.

**Delivered Energy:** Energy sold to the Applicant from Otter Tail.

**Delta Connected Circuit:** A three-phase circuit with three source windings connected in a closed delta (triangle). A closed delta is a connection in which each winding terminal is connected to the end (terminal) of another winding.

**Demand:** The rate at which electric power is delivered to or by a system; normally expressed in kilowatts, megawatts, or kilovolt-amperes.

**Direct Current (DC):** An electric current flowing in one direction only and substantially constant in value.

**Disconnect:** A device used to isolate a piece of equipment. A disconnect may be gang-operated (all poles switched simultaneously) or individually operated.

**Dispatchable:** Capable of having generator output (real and reactive power) adjusted ("dispatched") upon request of Otter Tail power system operator. The adjustment includes capability to start-up and shut down generating units.

**Energy Losses:** The general term applied to energy lost in the operation of an electrical system. Losses can be classified as Transformation Losses, Transmission Line Losses or System Losses.

**EMS:** Energy Management System. The computer system Otter Tail uses to provide real-time status and remote control of its electrical transmission system.

**EWG:** An Exempt Wholesale Generator is an Independent Power Producer (IPP) whose energy would be purchased based on a price other than the avoided cost of building a new unit.

**Facility:** The Applicant's electric generating, tie-line, or substation facility identified generally in the Interconnection and Operating Agreement and more specifically identified in the "as built" drawings provided to the Company in accordance with Section 9.4 of the Interconnection and Operating Agreement, together with the other property, facilities, and equipment owned and/or controlled by the Applicant on the Applicant's side of the Points of Interconnection.

**FERC:** Federal Energy Regulatory Commission. FERC is an independent body within the Department of Energy (DOE) regulating interstate transmission, prices of electricity and natural gas. It also licenses hydroelectric projects, interconnections, construction work in progress, rates for wholesale customers, and utility accounting practices and procedures.

**Frequency:** The number of cycles occurring in a given interval of time (usually one second) in an electric current. Frequency is commonly expressed in hertz.

**Fuse:** A short piece of conducting material of low melting point that is inserted in a circuit for the purpose of opening the circuit when the current reaches a certain value.

**Ground:** A term used in electrical work in referring to the earth as a conductor or as the zero of potential. For safety purposes, circuits are grounded while any work is being done on or near a circuit or piece of equipment in the circuit; this is usually called protective or safety grounding.

**Hertz:** The term denoting frequency, equivalent to cycles per second.

**Incoming Breaker:** The Applicant-owned breaker that connects Otter Tail source of power to the Applicant's bus.

**Interconnection:** The physical system of electrical transmission between the Applicant's generation and the utility.

**Interrupting Capacity:** The amount of current a switch, fuse, or circuit breaker can safely interrupt.

**Interruption:** A temporary discontinuance of the supply of electric power.

**IPP:** Independent Power Producer. An organization, which is not a utility, that operates a power plant, produces energy and then sells it to a utility.

**Island:** A part of an interconnected system that may be isolated during a system disturbance and start operating as a subsystem with its own generation, transmission and distribution capability. Then the subsystem becomes an island of the main interconnected system without a tie. In such a case, the islanded system and the main interconnected system will operate at different frequencies and voltages.

**Isolated:** In this scheme, the generating unit will supply all of the needs of the connected load.

**Kilovolt (kV):** One thousand volts.

**Kilovolt-Ampere (kVA):** One thousand volt amperes. See the definition for Apparent Power.

**Kilowatt (kW):** An electric unit of power that equals 1,000 watts.

**Kilowatthour (kWh):** One thousand watts of power supplied for one hour. A basic unit of electric energy equal to the use of 1 kilowatt for a period of one hour.

**Lagging Power Factor:** Occurs when reactive power flows in the same direction as real power.

**Leading Power Factor:** Occurs when reactive power flows in the opposite direction of real power.

**Line Losses:** Electrical energy converted to heat in the resistance of all transmission and/or distribution lines and other electrical equipment.

**NERC:** North American Electric Reliability Council. A national organization responsible for establishing the operating and planning standards to assure the reliability of the electric grid.

**Non-Spinning Reserve:** All unloaded generating capability not meeting the Spinning Reserve criteria that can be made fully effective in 10 minutes. This may include generation that shall be made available within 10 minutes by interrupting or curtailing loads or changing schedules.

**OASIS:** Open Access Same-time Information System - An Internet based system designed to allow all participants in the power market to obtain information concerning the capability and use of the transmission system in a non-discriminatory manner.

**Ohm:** The practical unit of electrical impedance equal to the resistance of a circuit in which a potential difference of 1 volt produces a current of 1 ampere.

**One-Line Diagram:** A diagram in which several conductors are represented by a single line and in which various devices or pieces of equipment are denoted by simplified symbols. The purpose

of such a diagram is to present an electrical circuit or circuits in a simple way so that their function can be readily grasped.

**Operating Reserve:** The sum of Spinning and Non-Spinning Reserve.

**Parallel Operation:** The operation of an Applicant-owned generator while connected to the utility's grid. Parallel operation may be required solely for the Applicant's operating convenience or for the purpose of delivering power to the utility's grid.

**Peak Load:** The maximum electric load consumed or produced in a stated period of time.

**Peak Shaving:** Generator operation that results in reducing Applicant's peak load or demand. Closed-transition peak shaving is the condition where the generator is in a parallel operation with Otter Tail's system. Open-transition peak shaving is the condition where the generator is **not** connected in parallel with the Otter Tail System.

**Point of Energy Exchange:** The point in the delivery system where one party takes delivery of the energy from the other party. This point is defined in the contract between Otter Tail and the Applicant. It is often the point where facility ownership changes. This point may also be called the Point of Interchange when dealing with a bi-directional energy exchange or the Point of Delivery if the energy flows in one direction.

**Point of Interconnection:** The point or points where the facilities of the Applicant interconnect with the facilities of Otter Tail (point of ownership change).

**Point of Metering:** The point where metering equipment (meters, transducers, current transformers, potential transformers, etc.) is or will be installed to measure the power flow and energy exchange between Otter Tail and the Applicant.

**Power: Actual, Active or Real Power.** The time rate of transferring or transforming energy or the power that accomplishes work. Measured in Watts.

**Power Factor:** The ratio of actual power (kW) to apparent power (kVA).

**Power Flow:** One-way power flow is the condition where the flow of power is entirely into the Applicant's Facility.

Two-way power flow is the condition where the net flow of power may be either into or out of the Applicant's Facility depending on the operation of the generator and other customer load.

**Power System Stabilizer:** Supplemental excitation device for dampening low-frequency oscillations.

**Protection:** All of the relays and other equipment that are used to open the necessary circuit breakers to clear lines or equipment when trouble develops.

**QF:** Qualifying Facility. An Independent Power Producer (IPP) that has met criteria to be certified by FERC as a Qualifying Facility and that has rights established by the PURPA of 1978.

**Reactive Power: (VAr)** The power that oscillates back and forth between inductive and capacitive circuit elements without ever being used. The function of reactive power is to establish and sustain the electric and magnetic fields required to perform useful work.

**Received Energy:** Energy received by Otter Tail from the Applicant.

**Reclose:** To return a circuit breaker to its closed position after it has opened by relay action.

**Relay:** A device that is operative by a variation in the condition of one electric circuit to affect the operation of another device in the same or in another electric circuit.

**Self-Excited:** An electric machine in which the field current is secured from its own armature current.

**Self-Service Generators:** Generators operated in parallel with the Otter Tail System only for the purpose of reducing the Applicant's peak load. These generators are not normally dispatchable by Otter Tail.

**Separately Excited:** Use of an exciter for sending current through the field windings of an electric machine in place of taking the field current from its own armature current.

**Spinning Reserve:** The amount of unloaded generating capability of a participant connected to and synchronized with the interconnected system of the participants and ready to take load. Spinning Reserve allocation to any generator shall not exceed the amount of generation increase that can be realized in 10 minutes.

**Switch:** A device for making, breaking or changing the connections in an electric circuit.

**Synchronism:** Expresses the condition across an open circuit wherein the voltage sine wave on one side matches the voltage sine wave on the other side in frequency and amplitude without phase angle difference.

**System:** The entire generating, transmitting and distributing facilities of an electric company.

**System Control Center:** Systems and System Operators used in the coordination and deployment activities required to support the safe and reliable operation of interconnected systems.

**System Operator:** A person authorized to operate or supervise the operation of the interconnected systems within the Control Area.

**Transformer:** An electric device, without continuously moving parts, in which electromagnetic induction transforms electric energy from one or more other circuits at the same frequency, usually with changes of value of voltage and current.

**Voltage:** Electric potential or potential difference expressed in volts.

**Volt-Ampere:** A unit of apparent power in an alternating-current circuit.

**VAR:** Volt ampere reactive, see Reactive Power.

**Watt-Hour:** A unit of work or energy equivalent to the power of one watt operating for one hour.

**Wheeling:** The use of transmission facilities of one utility system to transmit power to another utility system, or between customer facilities within a single utility system or between systems.

**Wholesale Generator:** A generator operated in parallel with the Otter Tail System and that provides power and energy for Otter Tail's purchase or for use by another Applicable Reliability Council member or non-member and/or where the Otter Tail System is utilized for delivery.

**Wye or "Y" Connected Circuit (Star Connected):** A three-phase circuit in which windings of all three phases have one common connection.

## Appendix A: Metering and Telemetry Requirements

### Metering Block Diagrams

#### Generator - Operate Isolated Only:

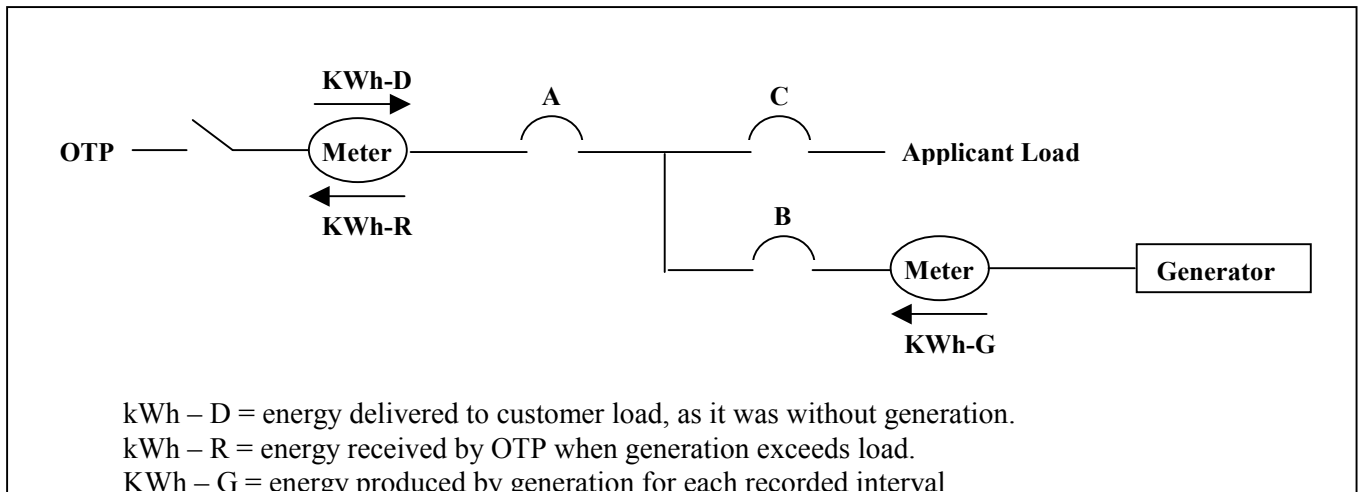

Switch A is always open when Switch B is closed, or A&B are both closed during a very short synchronizing and load transfer time.

Used as part of controlled service rate, or used to provide service during outage or to avoid blinks during lightning storm.

#### Generator – Synchronized:

Capacity (kW) is sold to Otter Tail. In order to bill for Applicant load, kWh interval data must be recorded and processed remotely. During periods when Otter Tail requests generation to operate, we pay for this energy. In this case, the Applicant load is  $= (\text{kWh-D}) + (\text{kWh-G}) - (\text{kWh-R})$  for each recorded interval. During periods when the Applicant runs generation for other reasons, the Applicant Load is equal to kWh-D and kWh-R is used to determine payment to Applicant for generation above load requirements for these intervals.

Metering and telemetry equipment are required to operate the power system as well as for energy exchange billing and accounting. Telemetry requirements are outlined in Section III.J. Regardless of metering and telemetry equipment ownership, Otter Tail, at a minimum, shall:

- Approve that the metering and telemetry design meet the requirements for that class of facilities.
- Inspect the final installation.
- Participate in jointly testing the metering and telemetry equipment during the installation and periodic testing.

## **A. METERING ACCURACY, TESTING, AND REPAIR**

### **1. Metering Accuracy**

The metering shall adhere to the accuracy standard specified in ANSI standard C-12.1 applicable at the time the metering is installed. Any current or potential transformers that are used for metering will adhere to the “Accuracy Classifications for Metering” listed in ANSI standard C-57.13.

### **2. Periodic Testing**

The metering equipment shall be tested periodically, and re-calibrated to maintain the required accuracy. The meter testing frequency shall at a minimum be based on industry accepted practices and guidelines outlined in ANSI standard C-12.1. Otter Tail’s present testing practices are based on the type of metering situation and the jointly agreed to requirements of both parties involved. Typically, the metering equipment at non-Otter Tail generation sites is tested every three years.

The periodic test frequency for the metering equipment will be decided upon during the interconnection studies.

Otter Tail and the Applicant shall both participate in the periodic testing. The party performing the testing must notify the witnessing party with at least a week’s notice, preferably more. If the proposed date is not acceptable, then an alternative time acceptable to both parties must be worked out.

The owner of the meter shall analyze and distribute any maintenance, repair, and test results to all parties receiving the meter readings.

### **3. Meter and Telemetry Equipment Repair**

The owner of the metering and telemetry equipment is responsible for ensuring that the equipment is adequately maintained and is repaired within a reasonable time after a failure is detected. The repair or replacement of a bad meter must be completed within 24

hours after it has been detected. If the metering cannot be repaired within that time, Otter Tail may request the Applicant to cease all generation until the meter has been repaired.

All changes, repairs, and replacements of the meter must be coordinated with the Otter Tail Meter Department. This assures Otter Tail that the meter is functioning properly.

## **B. METERING AND TELEMETRY FUNCTION REQUIREMENTS**

The meter and telemetry requirements define Otter Tail's required functionality for meters, metering related equipment (phone lines, phone circuits, current transformers, potential transformers, etc.) and telemetry equipment (Remote Terminal Units (RTUs), transmitters, receivers, etc.). They do not represent design standards for the metering point.

Three major factors generally determine the type of metering and telemetry required:

1. The type and size of the Applicant's Facility equipment.
2. The location of the Applicant on the Otter Tail System.
3. The manner in which the installation will operate (one-way vs. two-way power flow).

Each request will be handled individually and Otter Tail will solely determine the metering and telemetry modifications and/or additions required. Otter Tail will work with the Applicant to achieve an installation that meets the requirements of both the Applicant and Otter Tail. The Applicant shall bear the costs of metering and telemetry modifications required to permit the operation of parallel generation.

1. Measured Values and Metering Equipment Required For Generating Stations With A Net Output Capacity (generation less auxiliaries) Less than 1 MW
  - a. Real Energy Usage (Watt-hours)
  - b. Power factor or Reactive Energy Usage (Power Factor, VAR-hours, or Q-hours)
  - c. Interval Recorder to capture hourly energy use
2. Additional Measured Values For Generating Stations With A Net Output Capacity Greater Than Or Equal to 1 MW
  - a. Real Power Flow (Watts)
  - b. Reactive Power Flow (VARs), at Otter Tail's discretion
  - c. Voltage at the point of connection to Otter Tail (Volts), at Otter Tail's discretion
3. Additional point for units requiring Telemetry Generating Stations with a net output capacity of 5 MW or greater
  - a. Position (open/close) of generator breaker(s) and incoming and tie breakers (if present)

- b. Remote Terminal Unit or Data Link to telemeter all measured values to Otter Tail's SCADA System. This will capture the hourly energy usage; thus, eliminating the need for an interval recorder if the energy usage can be measured in MWhs.

### **C. ENERGY LOSSES**

If the energy is not measured at the point where the energy exchange between Otter Tail and the Applicant has been defined by contract, energy losses must be determined. Accounting for the losses may be either done by attributing losses to the monthly accounting of exchanged energy or by attributing losses directly to the energy registered on the meter. The latter case requires a compensated billing meter. Losses applied internal to the meter frequently result in a more complex metering and telemetering situation and, therefore, should be evaluated thoroughly before this approach is used. Transmission System Losses may not be applied through a compensated meter. Transformation Losses and/or specific Line Losses may be applied through a compensated meter. If the energy is not purchased by Otter Tail, and it is wheeled across Otter Tail's System, Otter Tail will require the Owner of the Facility to pay for Transmission System Losses.

Energy losses may be subject to change. If the connection to the Applicant's Facility changes or Otter Tail or other utilities files new loss rates, Otter Tail and the Applicant must re-evaluate the losses to be applied and incorporate any new loss factors into the metering and/or accounting.

### **D. METER READING**

General practice within NERC, MISO, or Applicable Reliability Council require that meter readings take place at midnight on the meter read day. For most cases, the meter read day will be the last day of the month.

A read through midnight of the billing day could be captured by physically reading the meter at midnight, storing the midnight reading and taking a reading of the stored value the following day (for meters with that capability) or remotely reading the meter at midnight (via a phone line). Energy readings though midnight can also be approximated by using the hourly energy usage captured in Otter Tail's EMS or on the interval recorder to extrapolate the value from the time the meter was read to midnight on the billing day. The specific method will be decided during the interconnection studies.

There may be situations where it is cost effective or necessary to access the metering equipment via telephone. Otter Tail prefers to share an existing phone line with the Applicant, but it may be necessary to install a new line. The communications circuit cost (telephone lines, phone charges, etc.) to allow remote reading of the meter at a non-Otter Tail facility should be borne by the party contracting with Otter Tail to supply or purchase energy.

## **E. ENERGY SCHEDULING**

All interchange energy requires hourly schedules because it directly impacts Otter Tail's Control Area and load calculations.

In accordance with NERC, MISO, and Applicable Reliability Council requirements, if an Applicant is not a NERC Certified Control Area, they cannot schedule energy and must coordinate with a control area to perform scheduling on their behalf. If the Facility is outside Otter Tail's control area, the Applicant must schedule the energy with the utility within whose control area the Facility resides. Otter Tail and the Applicant will have to agree upon the unit availability and the amount of energy desired.

## **F. BILLING AND REPORTING ENERGY PURCHASED BY OTTER TAIL**

Either Otter Tail or the Applicant may be responsible for processing the bill. This will be decided during the interconnection studies. Typically, Otter Tail produces the bill for the generator (self-bills) when the contract requires information from Otter Tail in order to calculate the bill. If Otter Tail provides the billing, Otter Tail shall be compensated for such services.

Otter Tail must report all purchases from Applicant-owned generation to the Federal Energy Regulatory Commission. Wheeling charges and losses associated with the purchases must also be reported.

### **Reference—Distributed Generation Interconnection Manual**

Otter Tail Power Company's Distributed Generation Interconnection Manual, dated October 8, 2007 is available upon request to the Company or on our web-site, <http://www.otpco.com/>. This manual provides the procedures for an interconnection process for distributed generation systems seeking to connect to the Otter Tail Power distribution power system and the interconnection requirements for the extended parallel distribution generation systems, with an aggregated capacity of 10MW's or less.
