Executive Summary

HDR conducted noise measurements at two residences near the Otter Tail Power Company (OTP) Astoria Station (the Station) on December 5-6, 2021 in order to determine compliance with applicable noise limits set forth by the South Dakota Public Utilities Commission (SDPUC) in Settlement Stipulation EL17-042. Two two-hour test periods were analyzed, with an average Station load of 274.1 MW and 277 MW, respectively.

The noise measurements were conducted by HDR acousticians under the direction of HDR's Acoustic Program Manager Tim Casey. On September 23, 2022 OTP submitted a noise test plan and request for HDR as an independent third-party noise consultant, which was approved by SDPUC Staff on September 26, 2022.

The L_{dn} limit of 55 dBA was evaluated using an effective A-weighted L_{eq} limit of 48.6 dBA for the operating period. This corresponds with a 55 dBA L_{dn} if the facility were to be operating constantly at that level for 24 hours. The L_{max} limit of 65 dBC was evaluating using the maximum 10-second C-weighted L_{eq} in a given operating period as a proxy for the instantaneous L_{max} . After excluding non-Station noise events based on attended observations and/or audio review, noise from the Station was found to be compliant with both the dBA and dBC limits for the entire test period at both measurement locations.

Noise Measurements Results
Astoria Station Project

1.0 Introduction

1.1 Scope of Work

Otter Tail Power Company (OTP) operates the Astoria Station Project, a 245-megawatt (MW) simple-cycle combustion turbine electric generation facility. The facility consists of one MHPS 501GAC gas turbine generator and supporting equipment which is fired solely on natural gas. The maximum rated capacity of the turbine varies with temperature and other meteorological conditions and can reach a load of approximately 270 to 286 MW under ideal operating conditions. The facility is located in Deuel County, South Dakota, in Scandinavia Township.

This report summarizes the measurement and data processing methodologies, and the compliance results at a variety of loads.

1.2 Noise Limits

For this project, the South Dakota Public Utilities Commission (SD PUC) established noise standards at the nearest occupied existing residences of:

- a. a day-night average (L_{dn}) sound level of 55 dB(A), which includes a nighttime penalty of 10 decibels; and
- b. a maximum (L_{max}) C-weighted sound level of 65 dB(C) applicable at all times.

The day-night average (L_{dn}) sound level is calculated by taking a logarithmic average of the hourly equivalent levels ($L_{eq(h)}$) over a 24-hour period, with the levels during nighttime hours (10 pm to 7 am) receiving a penalty of an additional 10 dB. Thus, for a facility operating around the clock, a constant hourly L_{eq} of 48.6 dBA would be needed to achieve an L_{dn} of 55 dBA. Therefore, the A-weighted L_{eq} for a test period of at least two hours is the metric with which compliance with the effective limit of 48.6 dBA was evaluated.

During a previous series of noise measurements at the site, HDR determined that the instantaneous C-weighted L_{max} limit of 65 dBC was frequently exceeded due to wind noise and other extraneous noise sources. Therefore, the maximum 10-second C-weighted L_{eq} was proposed in the approved test plan as a proxy for the L_{max} .

1.3 Noise Measurement Methodology

Figure 1 shows the location of the facility in relation to the noise measurement locations at the two nearest occupied residences.

Figure 1. Measurement Location and Noise-Sensitive Land Uses

HDR measured noise levels at the residence labeled ML1, approximately 3,800 feet southwest of the facility power block, and at the residence labeled ML2, approximately 6,000 feet east-

Noise Measurements Results
Astoria Station Project

southeast of the facility power block. These measurement locations represent the nearest occupied residences to the Station. Figure 2 and Figure 3 show the locations at the two monitoring locations where the equipment was placed.

Figure 2. ML1 Close-in View

Figure 3. ML2 Close-in View

HDR used a Larson Davis 831C sound level meter/real-time analyzer, equipped with a Larson Davis PRM2103 preamplifier and PCB Piezotronics 377B02 1/2-inch free-field microphone to measure sound levels and record continuous audio at each site. The microphone was fitted with a Larson Davis 079A06 windscreen and positioned approximately five feet above the ground. HDR configured the sound level meter to automatically correct the sound level measurements for the windscreen. The sound level meters, mics and preamps were within two years of laboratory calibration per ANSI S1.13-2005 (Reaffirmed 2010), "Measurement of Sound Pressure Levels in Air.", and were field-calibrated by HDR staff prior to and upon the completion

Noise Measurements Results
Astoria Station Project

of the noise measurements using a Larson Davis CAL200 Calibrator. The calibrator was laboratory-calibrated within one year of the measurement.

To record wind speed and direction, temperature, humidity, and barometric pressure, HDR deployed a Vaisala WXT536 weather station connected to the sound level meter. The weather station was positioned on its own tripod located approximately 6 feet away from the microphone to avoid interfering with the sound level measurements.

Section 2.3.1 and 2.3.2 of the Noise Test Plan (Plan) discussed OTP's original noise measurement strategy, which consisted of determining the maximum load at which the Station complied with the noise limits established by SD PUC (Section 2.3.1 of the Plan) and then performing the long-term compliance measurements (Section 2.3.2 of the Plan). During the maximum load determination, OTP intended to incrementally adjust the Station's operating load downward until short-term measurement results indicated compliance with the SD PUC noise limits. Upon initiating the maximum load determination, noise measurement results showed compliance with the SD PUC noise limits. Therefore, OTP did not incrementally adjust the operating load downward. Rather, the project team initiated the long-term compliance measurements as follows.

Measurements started at approximately 6:00 pm on Monday, December 5, 2022, and ended at approximately 4:00 pm on Tuesday, December 6, 2022. Two 2-hour test periods were identified for reporting during this time: 11:15 pm on December 5 until 1:15 am on December 6, and 3:00 am until 5:00 am on December 6. During these time periods, the Station was operating at or near full load, as discussed in a subsequent section.

The measurement sites were attended from 11:15 pm on December 5 until 1:15 am on December 6 for identification of extraneous noises. Identification of extraneous noises during the unattended periods was performed on the basis of audio review, which was informed by the characterization of sounds observed during the attended period.

2.0 Data Processing

2.1 Data Reduction

Measurement data was stored in 1-hour intervals as well as 1-second intervals. The 1-second data was used to calculate metrics for the test periods, including calculating the overall dBA L_{eq} and 10-second dBC L_{eq} values.

2.2 Precipitation

No precipitation was recorded during the test periods, therefore no exclusions for precipitation were made.

2.3 Wind

According to ANSI S12.9 Part 3, wind speeds above 5 m/s (11 mph) can cause spurious noise to be generated at the microphone. However, since no winds exceeded this speed during the test periods, no exclusions were made.

Based on previous measurements at the site, HDR determined that wind speeds in excess of 6 mph had the potential to cause levels in excess of the dBC limit to be recorded even when the Station was not operating. Although wind speeds in excess of 6 mph were recorded during the latter test period, they did not correlate with exceedances of the dBC limit, and thus were not excluded.

2.4 Background Noise

Background noise corrections were not necessary during the test periods, since the sum of Station noise and background noise was less than the limits except for discrete events as noted below.

2.5 Audio Review

Exceedances of the dBC limits were investigated using audio review. Each meter stored continuous, high-quality digital audio files during the measurement period. For the attended period, noise events were identified and noted as they occurred, with confirmation by audio review. For the unattended period, noise events were identified by audio review informed by observation of similar noise events during the attended period and other times when HDR staff were onsite. Noise events in excess of the limit that are not attributable to the Station were excluded and included the following:

- At 1:15 AM at ML1, a 10-second L_{Ceq} of 65.6 dBC was measured. HDR determined that the excess noise was caused by HDR staff closing the equipment case after checking that the equipment was functioning properly at the end of the attended portion of the measurement, and
- At 3:34 AM at ML1, a 10-second L_{Ceq} of 67.3 dBC was measured. HDR determined that the excess noise was caused by a passing truck on SD-28.

No events were excluded at ML2.

3.0 Measurement Results

The results of the measurement for each test period are shown in Table 1 below. For each period, the table includes:

- the start and stop times and duration,
- the Station's operating load range and average,
- average wind speed at each site,
- L_{Aeq} for the entire period at each site,

Noise Measurements Results
Astoria Station Project

- maximum 10-second L_{Ceq} for the period at each site,
- and an assessment of whether noise levels in the period at each site were compliant with the limits.

Table 1. Noise Monitoring Results

Measurement Location	ML1		ML2	
	1	2	1	2
Measurement Period

Ldn Limit (dBA)	55	55	55	55
Max. 10-second Leq (dBC)	62.8 ^(a)	64.5 ^(a)	55.1	62.2
dBC Limit	65	65	65	65
Complies? (Yes/No)	Yes	Yes	Yes	Yes
(a) Maximum level excludes noise determined to not be attributable to the Station as described above				

Measurement results show that noise emissions from the Station complied with the A- and C-weighted noise limits at both sites, during both measurement periods. Station noise was audible at ML1, and sound levels were generally stable during the duration of both measurement periods, with the 10-second LAeq typically ranging from approximately 38 to 45 dBA, and the 10-second LCEq typically ranging from approximately 58 to 63 dBC. At ML2, Station noise was audible, but difficult to distinguish from background sounds, which predominantly consisted of distant traffic noise and sounds from animals kept by the residence. Sound levels at ML2 generally ranged from 30 to 40 dBA and 50 to 55 dBC; however, there was more short-term variations in sound levels than at ML1. Upon audio review, HDR found that the short-term spikes in sound levels at ML2 were generally caused by traffic, airplanes, animals, and HDR staff checking the equipment during the attended measurement period.

The graphs at the end of this document show the noise data for each test period. Wind speed is also displayed, as is the Station load. The 10-second LAeq and LCEq levels are shown, with removed data shown in a lighter, dotted line. Dashed lines show the dBA and dBC limits. Note that while the LAeq limit may be briefly exceeded on a 10-second basis, compliance, the limit is evaluated against the overall LAeq for the entire test period, not the LAeq for the 10-second intervals. These brief spikes are typically associated with extraneous noise sources but were not removed as compliance was demonstrable regardless of their inclusion. A darker dashed-dotted line shows the overall LAeq to depict that measured sound levels comply with the A-weighted limit.

Noise Measurements Results
Astoria Station Project

4.0 Conclusion

The measurement results showed that during each of the test periods, noise from the Station complied with both the dBA L_{eq} limit and the dBC L_{max} limit at both measurement locations. The test periods corresponded to average loads of 274.1 MW and 277.0 MW, respectively.

Calibration Certificate

Certificate Number 2021007965

Customer:

HDR Engineering Inc
1601 Utica Avenue South
St. Louis Park, MN 55416, United States

Model Number	831C	Procedure Number	D0001.8384
Serial Number	11568	Technician	Ron Harris
Test Results	Pass	Calibration Date	1 Jul 2021
Initial Condition	As Manufactured	Calibration Due	
Description	Larson Davis Model 831C Class 1 Sound Level Meter Firmware Revision: 04.6.2R1	Temperature	23.62 °C ± 0.25 °C
		Humidity	51.7 %RH ± 2.0 %RH
		Static Pressure	86.32 kPa ± 0.13 kPa

Evaluation Method	Tested with:	Data reported in dB re 20 µPa.
	Larson Davis PRM2103, S/N 001835 PCB 377B02, S/N 330804 Larson Davis CAL200, S/N 9079 Larson Davis CAL291, S/N 0108	

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8378:

IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61260:2014 Class 1	ANSI S1.11-2014 Class 1
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017.

Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Correction data from Larson Davis SoundAdvisor Model 831C Reference Manual, I831C.01 Rev B, 2017-03-31

For 1/4" microphones, the Larson Davis ADP024 1/4" to 1/2" adaptor is used with the calibrators and the Larson Davis ADP043 1/4" to

LARSON DAVIS - A PCB PIEZOTRONICS DIV.
1681 West 820 North
Provo, UT 84601, United States
716-684-0001

Certificate Number 2021007965

1/2" adaptor is used with the preamplifier.

Calibration Check Frequency: 1000 Hz; Reference Sound Pressure Level: 114 dB re 20 µPa; Reference Range: 0 dB gain

Periodic tests were performed in accordance with procedures from IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part3.

No Pattern approval for IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 available.

The sound level meter submitted for testing successfully completed the periodic tests of IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part 3, for the environmental conditions under which the tests were performed. However, no general statement or conclusion can be made about conformance of the sound level meter to the full specifications of IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 because (a) evidence was not publicly available, from an independent testing organization responsible for pattern approvals, to demonstrate that the model of sound level meter fully conformed to the class 1 specifications in IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 or correction data for acoustical test of frequency weighting were not provided in the Instruction Manual and (b) because the periodic tests of IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part 3 cover only a limited subset of the specifications in IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1.

Calibration Certificate

Certificate Number 2021009324

Customer:

HDR Engineering Inc
1601 Utica Avenue South
Suite 600
Minneapolis, MN 55416, United States

Model Number	831C	Procedure Number	D0001.8384
Serial Number	11571	Technician	Eric Olson
Test Results	Pass	Calibration Date	2 Aug 2021
Initial Condition	AS RECEIVED same as shipped	Calibration Due	
Description	Larson Davis Model 831C Class 1 Sound Level Meter Firmware Revision: 04.6.2R1	Temperature	24 °C ± 0.25 °C
		Humidity	52.3 %RH ± 2.0 %RH
		Static Pressure	86.78 kPa ± 0.13 kPa

Evaluation Method **Tested with:** **Data reported in dB re 20 µPa.**

Larson Davis PRM2103, S/N 001905
Larson Davis CAL291, S/N 0203
Larson Davis CAL200, S/N 6768
PCB 377B02, S/N 330809

Compliance Standards Compliant to Manufacturer Specifications and the following standards when combined with Calibration Certificate from procedure D0001.8378:

IEC 60651:2001 Type 1	ANSI S1.4-2014 Class 1
IEC 60804:2000 Type 1	ANSI S1.4 (R2006) Type 1
IEC 61260:2014 Class 1	ANSI S1.11-2014 Class 1
IEC 61672:2013 Class 1	ANSI S1.43 (R2007) Type 1

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the International System of Units (SI) through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017.

Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

This report may not be reproduced, except in full, unless permission for the publication of an approved abstract is obtained in writing from the organization issuing this report.

Correction data from Larson Davis SoundAdvisor Model 831C Reference Manual, I831C.01 Rev B, 2017-03-31

For 1/4" microphones, the Larson Davis ADP024 1/4" to 1/2" adaptor is used with the calibrators and the Larson Davis ADP043 1/4" to 1/2" adaptor is used with the preamplifier.

LARSON DAVIS - A PCB PIEZOTRONICS DIV.
1681 West 820 North
Provo, UT 84601, United States
716-684-0001

Certificate Number 2021009324

Calibration Check Frequency: 1000 Hz; Reference Sound Pressure Level: 114 dB re 20 µPa; Reference Range: 0 dB gain

Periodic tests were performed in accordance with precedures from IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part3.

No Pattern approval for IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 available.

The sound level meter submitted for testing successfully completed the periodic tests of IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part 3, for the environmental conditions under which the tests were performed. However, no general statement or conclusion can be made about conformance of the sound level meter to the full specifications of IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 because (a) evidence was not publicly available, from an independent testing organization responsible for pattern approvals, to demonstrate that the model of sound level meter fully conformed to the class 1 specifications in IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1 or correction data for acoustical test of frequency weighting were not provided in the Instruction Manual and (b) because the periodic tests of IEC 61672-3:2013 / ANSI/ASA S1.4-2014/Part 3 cover only a limited subset of the specifications in IEC 61672-1:2013 / ANSI/ASA S1.4-2014/Part 1.

Calibration Certificate

Certificate Number 2022007293

Customer:
HDR Engineering Inc

Model Number	CAL200	Procedure Number	D0001.8386
Serial Number	2556	Technician	Scott Montgomery
Test Results	Pass	Calibration Date	8 Jun 2022
Initial Condition	AS RECEIVED same as shipped	Calibration Due	8 Jun 2023
Description	Larson Davis CAL200 Acoustic Calibrator	Temperature	24 °C ± 0.3 °C
		Humidity	31 %RH ± 3 %RH
		Static Pressure	101.2 kPa ± 1 kPa

Evaluation Method The data is acquired by the insert voltage calibration method using the reference microphone's open circuit sensitivity. Data reported in dB re 20 µPa.

Compliance Standards Compliant to Manufacturer Specifications per D0001.8190 and the following standards:
IEC 60942:2017 ANSI S1.40-2006

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the SI through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017. **Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.**

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.

Calibration Certificate

Certificate Number 2022007297

Customer:
HDR Engineering Inc

Model Number	CAL200	Procedure Number	D0001.8386
Serial Number	3722	Technician	Scott Montgomery
Test Results	Pass	Calibration Date	8 Jun 2022
Initial Condition	Adjusted	Calibration Due	8 Jun 2023
Description	Larson Davis CAL200 Acoustic Calibrator	Temperature	24 °C ± 0.3 °C
		Humidity	31 %RH ± 3 %RH
		Static Pressure	101.1 kPa ± 1 kPa

Evaluation Method The data is acquired by the insert voltage calibration method using the reference microphone's open circuit sensitivity. Data reported in dB re 20 µPa.

Compliance Standards Compliant to Manufacturer Specifications per D0001.8190 and the following standards:
IEC 60942:2017 ANSI S1.40-2006

Issuing lab certifies that the instrument described above meets or exceeds all specifications as stated in the referenced procedure (unless otherwise noted). It has been calibrated using measurement standards traceable to the SI through the National Institute of Standards and Technology (NIST), or other national measurement institutes, and meets the requirements of ISO/IEC 17025:2017. **Test points marked with a ‡ in the uncertainties column do not fall within this laboratory's scope of accreditation.**

The quality system is registered to ISO 9001:2015.

This calibration is a direct comparison of the unit under test to the listed reference standards and did not involve any sampling plans to complete. No allowance has been made for the instability of the test device due to use, time, etc. Such allowances would be made by the customer as needed.

The uncertainties were computed in accordance with the ISO Guide to the Expression of Uncertainty in Measurement (GUM). A coverage factor of approximately 2 sigma (k=2) has been applied to the standard uncertainty to express the expanded uncertainty at approximately 95% confidence level.
