# 1948 Definition of health

## CONSTITUTION OF THE WORLD HEALTH ORGANIZATION<sup>1</sup>

THE STATES Parties to this Constitution declare, in conformity with the Charter of the United Nations, that the following principles are basic to the happiness, harmonious relations and security of all peoples:

Health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity.

The enjoyment of the highest attainable standard of health is one of the fundamental rights of every human being without distinction of race, religion, political belief, economic or social condition.

# Acknowledgement: annoyance

n Annoyance is acknowledged to be an adverse health effect. <sup>1,2,3,4,5</sup>

# Definition: sound versus noise

- n World Health Organization defines noise as “unwanted sound” [1]
- n Sound meters can assess sound; however, humans assess “noise”
- n Humans are being considered as “objective measuring instruments (New Experts), whose reports and descriptions must be taken seriously and quantified by technical measurements.” [2]

# 2011 Review

## Wind Turbine Infra and Low-Frequency Sound: Warning Signs That Were Not Heard

There is sufficient research and history to link the sensitivity of some people to inaudible amplitude-modulated infra and low-frequency noise to the type of symptoms described by those living near industrial wind turbines.

This information should have served as a warning sign.

- n James, Richard R. Wind Turbine Infra and Low-Frequency Sound: Warnings Signs That Were Not Heard DOI: 10.1177/0270467611421845 Bulletin of Science Technology & Society published online 15 December 2011

### VIII. RECOMMENDATIONS

#### A. Research needs

Further research is needed in relation to a number of features and outcomes of low-frequency noise. These needs include the following.

(1) In general, there has been too little research on the role of different frequency spectra of noise in the production of effects on humans. Greater consideration of this factor in many studies of noise is desirable.

(2) Most of the research of adverse effects of low-frequency noise in humans has used short durations of exposure. It is of great importance to research prolonged expo-

**2012**

**A Cooperative Measurement Survey and Analysis of  
Low Frequency and Infrasound at the Shirley Wind Farm in  
Brown County, Wisconsin**

The four investigating firms are of the opinion that enough evidence and hypotheses have been given herein to classify LFN and infrasound as a serious issue, possibly affecting the future of the industry. It should be addressed beyond the present practice of showing that wind turbine levels are magnitudes below the threshold of hearing at low frequencies.

**2012**

## Falmouth Health Department

The Falmouth Board of Health requests that Mass DPH immediately initiate a health assessment of the impacts of the operation of wind turbines in Falmouth. This appeal is compelled by two years of consistent and persistent complaints of health impacts during turbine operation.

**Due to the increasing intensity of the reported health impacts, the Board is considering emergency actions**. To determine the appropriateness of such actions, the Board requests immediate guidance on interim measures to protect the health of affected individuals while the complete health assessment is being conducted.

# 2012 WHO: short- and long-term health problems

## n “Facts and figures

n Noise is an underestimated threat that can cause a number of short- and long-term health problems, such as for example sleep disturbance, cardiovascular effects, poorer work and school performance, hearing impairment, etc.”

n World Health Organization Noise Facts and Figures, Sited December 23, 2012, <http://www.euro.who.int/en/what-we-do/health-topics/environment-and-health/noise/facts-and-figures> cited dec 23 2012

# **Low frequency noise guidelines**

# 2009 Low frequency noise guidelines

From: Minister, MOE (ENE)  
Sent: July 13, 2009 3:56 PM

It is proposed that wind turbines would not be permitted less than 550 metres from the nearest dwelling and this minimum setback would increase with the number and loudness of turbines. It is also proposed that there would be setback distances from all roads, railways, and property side and rear lot lines, and there would be ongoing requirements to monitor and address low frequency noise and vibrations.

Sincerely,

John Gerritsen  
Minister

# 2009 LFN/infrasound guidelines

- n “...CanWEA submits that the proposed requirement for infrasound or low frequency noise monitoring as a condition of the REA be removed.”
  - n CanWEA EBR Posting 010-6516 (Proposed Ministry of the Environment Regulations to Implement the Green Energy and Green Economy Act. 2009) – CanWEA’s Supplemental Submission Dated July 24, 2009, EBR Comment ID 123788. Signed Robert Hornung President.

# 2011 LFN/infrasound guidelines

Vestas

In fact, according to our analyses, the most economical turbines, the 3 MW category, are the ones that will be strongly affected by the new rules. This applies to open terrain in particular, where in future low frequency noise will dictate and increase the distance requirements to neighbours for close to half of the projects that we are already aware of over the next 2 to 3 years.

The proposed low frequency limit values may hinder the development of onshore wind in Denmark, including meeting our commitments in relation to the EEC. Ultimately, we consider there is a danger that the regulations will be copied by other countries and accordingly this will provide an obstacle to the popularisation of wind energy at a global level. Both issues will damage Vestas as a business, including affecting Danish activities.

Vestas Wind systems A/S

Randers, 29 June 2011/erkjs

**Wrap up**

# 2009 Health effect “Conclusively demonstrated”

“Health Canada provides advice on the health effect of noise and low-frequency electric and magnetic fields from proposed wind turbine projects, particularly for environmental assessments done under the Canadian Environmental Assessment Act. To date, their examination of the scientific literature on wind turbine noise is that the only health effect conclusively demonstrated from exposure to wind turbine noise is an increase of self-reported general annoyance and complaints (i.e., headaches, nausea, tinnitus, vertigo).”<sup>48</sup>

Correspondence from the Honourable Rona Ambrose, June 30, 2009

# 2010 ON Freedom of Information - 30 to 32 dBA recommended

n “... the setback distances should be calculated using a sound level limit of **30 to 32 dBA** at the receptor, instead of the 40 dBA sound level limit.”

n MOE memorandum, Ontario Senior Environmental Officer, April 9, 2010

## 2010 MOE Freedom of Information on setback / noise

n “It appears compliance with the minimum setbacks and the noise study approach currently being used to approve the siting of WTGs **will result or likely result in adverse effects...**”

n MOE memorandum, Ontario Senior Environmental Officer, April 9, 2010

# 2010 Setbacks and noise levels expected to adversely affect some

n “The audible sound from wind turbines, at the levels experienced at typical receptor distances in Ontario, is nonetheless **expected to result in a non-trivial percentage of persons being highly annoyed**. As with sounds from many sources, research has shown that **annoyance associated with sound from wind turbines can be expected to contribute to stress related health impacts** in some persons.”

n Low frequency Noise and Infrasound Associated with Wind Turbine Generation Systems, A Literature Review, Ontario Ministry of Environment RFP December 10, 2010 [MOE consultant report]

# 2011 Environmental Review Tribunal

- n “This case has successfully shown that the debate should not be simplified to one about whether wind turbines **can cause harm** to humans. The evidence presented to the Tribunal demonstrates that **they can**, if facilities are placed too close to residents. The debate has now evolved to one of degree.”

- n Case Nos.: 10-121/10-122 Erickson v. Director, Ministry of the Environment  
Environmental Review Tribunal, Decision, p 207

# 2013 Health Canada wind turbine noise study

Dr. Michaud acknowledged that there is credible scientific support for an association between wind turbine noise and community annoyance. He explained that the study will help to build the evidence base to determine the link between noise created by wind turbines, including infrasound and low frequency, and variables like sleep disturbance, stress, quality of life and annoyance.

Dr. David Michaud, meeting with MP Poilievre June 2013 newsletter

# 1999 WHO precaution in general

n “...where there is a reasonable possibility that public health will be damaged, action should be taken to protect public health without awaiting full scientific proof.”

n World Health Organization, Guidelines for Community Noise, WHO (1999).

<http://www.who.int/docstore/peh/noise/guidelines2.html>

# Children: precaution

- n Policy Interpretation Network on Children's Health and Environment:
  - n "Policies that may protect children's health or may minimise irreversible health effects should be implemented, and policies or measures should be applied based on the precautionary principle, in accordance with the Declaration of the WHO Fourth Ministerial Conference on Environment and Health in Budapest in 2004."
  - n Report WP7 Summary PINCHE policy recommendations Policy Interpretation Network on Children's Health and Environment (PINCHE) Policy Interpretation Network on Children's Health and Environment QLK4-2002-02395

# Observations

- n Government lack of acknowledgement of health issues
- n Burden of proof of causality before prevention and precaution
- n Reported loss of trust in the processes/systems
- n Loss of decision-making rights (imposed without consent)
- n Characterizations: “NIMBYISM” [not in my backyard]; “anti-wind”, “anti-wind activist”; “opponent”; and attributing negative effects based on fright factors/lack of financial agreements/ *nocebo* effect.
- n Community / individual financial burdens: consultation and appeal processes; relocate; remain exposed; enter into legal actions

# Conclusion

- n Acknowledge that:
  - n Experimental and human research on noise including low frequency noise/infrasound and risk factors are available.
  - n If sited too close to residences, wind turbines can cause harm to humans.
  - n Children are vulnerable to effects of noise.
- n Invoke prevention and precaution before approving more projects.
- n Provide relief/remedy to those reporting harm.
- n Implement vigilance and long term surveillance monitoring.
