Summary

Ryan Haggerty/USFWS

White-tailed Deer

Every year, millions of migratory waterfowl and other waterbirds find their way to a mosaic of wetlands and grasslands in eastern South Dakota. These habitats provide the untiring winged travelers with the sanctuary and nourishment necessary to procreate, giving rise to the future generations of migratory birds that will populate North America's Central Flyway. These lands are also of critical importance to a myriad of other endemic fish, wildlife, and plant species, and they provide thousands of sportsmen and wildlife enthusiasts with places to experience the wonders of the natural world and partake in its bounty.

It is the responsibility of the U.S. Fish and Wildlife Service to preserve the integrity of these important habitats for the benefit of fish and wildlife, as well as for the continuation of compatible outdoor recreational uses derived therein. The Service accomplishes this through a network of federally managed lands dedicated to the preservation of fish, wildlife, plants, and the habitats upon which they depend—the National Wildlife Refuge System.

The Districts

The Huron Wetland Management District, Madison Wetland Management District, and Sand Lake Wetland Management District are units of the Refuge

System that manage small tracts of fee-owned Federal lands called waterfowl production areas, administer easement programs to preserve privately owned wetlands and grasslands, and conserve other tracts of lands ceded to the Service through different authorities, such as former Farmers Home Administration lands. Together, these three districts encompass 27 counties in eastern South Dakota, where their staffs manage approximately 1.5 million acres of land including more than 378,000 acres in wetlands easements, nearly 630,000 acres in grassland easements, more than 100,000 acres of fee-owned lands distributed in 445 waterfowl production areas, and miscellaneous other tracts of land.

All 445 waterfowl production areas managed by these districts are open to the public to engage in compatible wildlife-dependent recreational uses, of which hunting and fishing, followed by wildlife observation and photography, are the ones that attract the greatest number of visitors each year. Biannual bird migrations each spring and fall attract thousands of local residents as well as tourists from around the world to experience this breathtaking display of one of nature's profound cycles. Environmental education and interpretation are other compatible public uses that take place at certain designated sites within each district, usually requiring closer involvement of district staffers.

VISION FOR THE DISTRICTS

Clear blue skies frame spectacular views of grasslands and wetlands teeming with migratory waterfowl and other wildlife in the Huron, Madison, and Sand Lake Wetland Management Districts. Here, future generations will experience the whistle of the northern pintail, the song of the western meadowlark, and the distant boom of the prairie chicken. Located in the Prairie Pothole Region of South Dakota, these districts preserve timeless landscapes in the face of change. Conservation of these lands is achieved through hard work and the support of friends and neighbors who value natural places as an essential component of their quality of life.

GOALS FOR THE DISTRICTS

Native Prairie

Conserve, restore, and improve the biological integrity and ecological function of the native prairies to support healthy populations of native plants and wildlife and promote the natural role of fire and grazing in shaping and managing these landscapes.

Planted Grasslands

Manage planted grasslands to contribute to the production and growth of continental waterfowl populations, other migratory birds, threatened and endangered species, and other wildlife.

Wetlands

Protect, restore, and enhance prairie pothole wetlands to support diverse plant communities and provide habitat to waterfowl, shorebirds, wading birds, and associated wetland-dependent wildlife.

Research and Monitoring

Provide a learning platform that uses science, monitoring, applied research, and adaptive management to advance understanding of the Prairie Pothole Region and management of these areas.

Consumptive Uses

Provide visitors with quality opportunities to enjoy hunting, fishing, and trapping in waterfowl production areas and expand their knowledge and appreciation of the prairie landscape and the National Wildlife Refuge System.

Nonconsumptive Uses

Provide visitors with quality opportunities to enjoy, observe, photograph, and appreciate the prairie ecosystem while expanding their knowledge of and support for the National Wildlife Refuge System.

Operations and Administration

Through effective communication and innovative partnerships, secure and efficiently utilize funding, staffing, and volunteer programs for the benefit of all natural resources in the districts.

Partnerships

Promote and develop partnerships with landowners, public and private organizations, and other interested individuals to maintain, restore, and enhance a diverse and productive landscape in the Prairie Pothole Region.

Environmental Education and Interpretation

Provide quality educational opportunities for persons of all abilities to learn about, understand, and appreciate prairie landscapes and the role of the National Wildlife Refuge System.

Planning Process and Issues

The comprehensive conservation planning process for these districts began in April 2008 with public notices on the Service's intent to prepare this plan, seek public input, hold public meetings, and identify key issues to be addressed in the plan. The following is a summary of the issues identified and that are covered within the scope of this plan.

WETLAND AND UPLAND HABITATS

Wetland and upland habitats within the planning area are in need of protection and enhancement. The current and likely future staffing situation at the districts requires that habitat management and protection be carefully evaluated and eventually follow a system of prioritization so that the districts can fulfill the purposes for which they were established.

INVASIVE PLANTS

Previously farmed lands that have been restored to a semblance of native prairie are compromised by invasive plant species such as leafy spurge, Canada thistle, sow thistle, and absinth wormwood. Other invasive plants of concern to the districts, and that substantially degrade the quality and suitability of habitats for wildlife species, include smooth brome, Kentucky bluegrass, and crested wheatgrass.

ENERGY DEVELOPMENT

Increasing demand for energy, particularly in the form of biofuel and wind energy production, is becoming a great concern for the districts due to these industries'

potential to affect wildlife habitat quality and integrity. The Service needs to study and analyze ways in which to support our Nation's increasing energy needs while affording adequate protection to fish, wildlife, plants, and the habitats on which they depend.

PRAIRIE CONVERSION

Conversion of native prairie to agricultural, urban, and other uses is of great concern to the Service and to many conservation and traditional ranching advocacy groups. The districts play a preeminent role in helping to preserve and enhance remaining prairie lands in South Dakota, as well as in helping to restore degraded or previously converted lands back to native prairie.

PREDATOR MANAGEMENT

Because of modifications to native prairie and other factors, the populations of several predatory species have increased above their historical levels. This situation adversely affects the ability and success of grassland-nesting bird species, including waterfowl and other migratory birds, to maintain or increase sustainable population levels. The Service needs to find ways to counter these deleterious effects in order to fulfill the purposes for which the districts were established.

VISITOR SERVICES

There is an increasing demand by local residents and tourists for places to engage in outdoor recreational opportunities. The districts, through the six wildlife-dependent priority uses—hunting, fishing, wildlife observation, photography, environmental education, and interpretation—are uses currently authorized on lands administered by the districts. A growing demand for public recreation in South Dakota and the nation makes these six wildlife-dependent recreational uses, as specified in the National Wildlife Refuge System Improvement Act, an issue of primary interest.

PARTNERSHIPS

The Service puts a high priority on working in partnership with conservation and agricultural groups to support conservation programs such as Federal Farm Bill legislation, South Dakota Game, Fish and Parks projects, water quality and watershed projects, and private conservation efforts.

OPERATIONS

Funding and staff are not sufficient to fulfill the districts' purposes or to meet their goals. Consequently, identification of priorities and efficient direction of resources will always be an issue. The Service's staff needs to identify and describe unfunded needs to be able to compete effectively for additional money from within the Service as well as from partners and other sources. District facilities need to be evaluated and upgraded.

MONITORING AND RESEARCH

Monitoring habitat and wildlife populations is an essential element in achieving the districts' primary goals and objectives. Basic data about recruitment, mortality, and habitat use for a representative group of species must be collected and analyzed on a regular basis to make appropriate decisions for maintaining the viability of the habitats on which these species depend. Using the districts for field research could contribute to new directions in management and expand the knowledge of field biologists.

Management Direction

Management of the three districts will emphasize developing and implementing an improved, science-based priority system to restore native prairie habitats for the benefit of waterfowl and other migratory birds. District staff will focus on high-priority tracts and, when possible, on medium-priority tracts. The focus of this alternative is to restore ecological processes and native grassland species to the greatest extent possible within the parameters of available resources and existing constraints. District staff will seek to maintain the existing levels and types of public use programs, ensuring that programs offered to the public are of consistently high quality.
