BEFORE THE SOUTH DAKOTA PUBLIC UTILITIES COMMISSION RECEIVED

DOCKET NO. EL05-022

IN THE MATTER OF THE APPLICATION BY OTTER TAIL POWER
COMPANY ON BEHALF OF THE BIG STONE II CO-OWNERS FOR AN
ENERGY CONVERSION FACILITY PERMIT FOR THE CONSTRUCTION OF
THE BIG STONE II PROJECT

Direct Testimony of

Olesya Denney, Ph.D.

QSI CONSULTING, INC.

On Behalf of

the Staff of the Public Utilities Commission of South Dakota

May 19, 2006

7325

# TABLE OF CONTENTS

7326

**QSI** consulting, inc.

# I. WITNESS INTRODUCTION

**Q.** PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

**A.** My name is Olesya Denney. My business address is 6110 Cheshire Line North, Plymouth, MN 55446.

**Q.** BY WHOM ARE YOU EMPLOYED AND IN WHAT CAPACITY?

**A.** I am employed as a Senior Consultant by QSI Consulting, Inc., a consulting firm specializing in regulated utility industries.

**Q.** PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND AND PROFESSIONAL EXPERIENCE.

**A.** I hold a Ph.D. in Economics from Oregon State University (Corvallis, OR). In addition, I hold a M.S. in Economics from the same institution and a B.S. in Economics from Novosibirsk State University (Russia). My professional experience that is directly relevant to this testimony stems from my academic work, as well as graduate studies in the field of natural resource and environmental economics. This work included academic research concerning the environmental impact of energy industries at the Institute of Economics (Novosibirsk, Russia) and teaching a course of Environmental and Natural Resource Economics at Novosibirsk State University (Russia). My master's studies at Oregon State University focused on the empirical methods for economic valuation of non-market goods such as open space and other

7827

1   environmental amenities. I have several academic publications.

2         Also relevant to this testimony is my experience in state regulatory

3   proceedings: While working at QSI Consulting, Inc. and earlier at AT&T, I

4   assisted expert witnesses with economic and quantitative analysis and testimony

5   in approximately twenty telecommunications cases. In addition, I filed my own

6   testimony in the telecommunications cost case U-13531 of the Michigan Public

7   Service Commission. Exhibit A to this testimony contains my resume.

8

9   Q.   ON WHOSE BEHALF WAS THIS TESTIMONY PREPARED?

10  A.   This testimony was prepared on behalf of the Staff of the Public Utilities

11       Commission of South Dakota.

12

13  **II.   PURPOSE OF TESTIMONY**

14  Q.   **PLEASE STATE THE PURPOSE OF YOUR TESTIMONY IN THIS**

15       **PROCEEDING.**

16  A.   The main objective of Staff in this proceeding is to ensure that the Co-owners

17       have met the requirements of applicable portions of the South Dakota Codified

18       Law ("SDCL") Chapter 49-41B and the Administrative Rules of South Dakota

19       ("ARSD") Section 20:10:22, with respect to the Co-owners application for a

20       Permit (Application) for a 600 MW (net) coal-fired electric generating facility and

21       associated facilities known as Big Stone II (or, the Project).

QSI
consulting, inc.

1    More specifically, according to SDCL 49-41B-13, the Co-owners'

2    Application may be denied, returned, or amended at the discretion of the Public

3    Utilities Commission for:

4    1) Any deliberate misstatement of a material fact in the application or in

5    accompanying statements or studies required of the applicant;

6    2) Failure to file an application generally in the form and content

7    required; or

8    3) Failure to deposit the initial amount with the application as required by

9    § 49-41B-12.

10   Further, SDCL 49-41B-22 states that it is the Applicant's burden of proof to

11   establish that:

12   1) The proposed facility will comply with all applicable laws and rules;

13   2) The facility will not pose a threat of serious injury to the environment

14   nor to the social and economic condition of inhabitants or expected

15   inhabitants in the siting area;

16   3) The facility will not substantially impair the health, safety or welfare

17   of the inhabitants; and

18   4) The facility will not unduly interfere with the orderly development of

19   the region with due consideration having been given the views of

20   governing bodies of affected local units of government.

21

22   Q.   ARE THERE OTHER AREAS WHICH YOU WILL EVALUATE IN

23        YOUR TESTIMONY?

7829

A.  Yes.  In addition to ensuring that the Applicant has complied with all laws and
rules, I will provide the Commission with additional information relevant to the
Commission's stated purpose of promoting consumer utility interests through
public policy.[1]

Q.  **HOW WILL YOUR TESTIMONY BE ORGANIZED?**

A.  The next section of my testimony will address the Applicant's legal requirements,
focusing on the specific language found in South Dakota statutes.  I will highlight
the requirements that were not fully addressed, such as the calculation of
environmental impacts of the project.  I will present Staff's own calculation of the
monetized negative environmental impacts, and compare them to the positive
economic impacts of the project.  I will, in the final section of my testimony,
provide the Commission with high-level analysis regarding additional potential
risks to consumers associated with the development of this Project.

## III.  EVALUATION OF THE APPLICATION

Q.  **PLEASE EXPLAIN YOUR GENERAL APPROACH TO THIS
TESTIMONY.**

A.  This testimony is structured to address the main criteria for evaluating the
Application contained in SDCL 49-41B and ARSD 20:10:22.  These criteria are
grouped into the following five categories:

---

[1]  According to the South Dakota Public Utilities Commission website,
http://www.state.sd.us/puc/whatispuc/index.htm, one of the Commission's objectives is stated as
follows: "Assists the public in making wise utility choices, promote consumer utility interests
through public policy, and resolves disputes between customers and their utilities."

| Table 1. Criteria for Evaluation of the Application | |
|---|---|
| **A. Completeness of the Application** | |
| SDCL 49-41B-13 | An application may be denied, returned, or amended at the discretion of the Public Utilities Commission for: |
| | (2) Failure to file an application generally in the form and content required by this chapter and the rules promulgated thereunder; |
| **B. Deliberate misstatements** | |
| SDCL 49-41B-13 | An application may be denied, returned, or amended at the discretion of the Public Utilities Commission for: |
| | (1) Any deliberate misstatement of a material fact in the application or in accompanying statements or studies required of the applicant. |
| **C. Compliance with all applicable laws and rules** | |
| SDCL 49-41B-22 | Applicant's burden of proof. The applicant has the burden of proof to establish that: |
| | (1) The proposed facility will comply with all applicable laws and rules; |
| **D. Environmental Impacts** | |
| SDCL 49-41B-22 | Applicant's burden of proof. The applicant has the burden of proof to establish that: |
| | (2) The facility will not pose a threat of serious injury to the environment nor to the social and economic condition of inhabitants or expected inhabitants in the siting area; |
| | (3) The facility will not substantially impair the health, safety or welfare of the inhabitants; |
| **E. Community Impacts** | |
| SDCL 49-41B-22 | Applicant's burden of proof. The applicant has the burden of proof to establish that: |
| | (3) The facility will not substantially impair the health, safety or welfare of the inhabitants; |
| | (4) The facility will not unduly interfere with the orderly development of the region with due consideration having been given the views of governing bodies of affected local units of government. |

## II.    Evaluation of the Application

## A.    *Completeness of the Application*

Q.    IS THE APPLICATION COMPLETE AS DEFINED BY THE

REQUIREMENTS OF SDCL 49-41B AND SPECIFIED IN ARSD 20:10:22?

1    A.    The application addresses most of the issues required by SDCL 49-41B and

2          ARSD 20:10:22. For example, the Application contains a reference table[2] that

3          lists the description of each section of ARSD 20:10:22 and provides references to

4          the corresponding sections of the Application where the requirements of the

5          specific section of ARSD 20:10:22 are addressed. However, a close reading of

6          the requirements of each section of ARSD 20:10:22 shows that certain issues are

7          addressed without the specific details required by the rule. Examples of the

8          missing details include the absence of required maps, estimates of monetary cost

9          of decommissioning, description of irreversible changes, etc. Table 2 provides a

10         list of missing details explicitly required by rule and explains whether the missing

11         information was adequately addressed in discovery:

---

[2]    Application, pp. xiii-xiv.

**Table 2. Matrix of Requirements to Application Content**

| ARSD Section | Description | Details Missing in the Application — Description | Details Missing in the Application — Addressed in Discovery or Testimony |
|---|---|---|---|
| 20:10:22:01 | Definitions | Not Applicable | |
| 20:10:22:02 | Content of notification of intent | Not Applicable | |
| 20:10:22:03 | Prefiling conference | Not Applicable | |
| 20:10:22:04 | General information of application for permit | Not Applicable | |
| 20:10:22:05 | Application contents | List of permits does not "state when each permit application will be filed." | Partially: Staff 1-5: Dates for filing some (but not all) permits were provided. |
| 20:10:22:06 | Names of participants | Not all names/phone numbers of "all persons participating in the proposed facility" were provided. | Yes: Staff 2-6. |
| 20:10:22:07 | Name of owner and manager | Description of the rights of ownership not provided. | Yes: Staff 1-1. |
| 20:10:22:08 | Purpose of facility | | |
| 20:10:22:09 | Estimated cost of facility | | |
| 20:10:22:10 | Demand for facility | Data, data sources, forecast methods or models not provided. | Yes: Intervenors RFP 1-3 (Specific data and models not provided). Staff 3rd Set ## 2, 8, 9, 17, 19, 24, 28. |
| 20:10:22:11 | General site description | Maps of cemeteries, historical properties and other public facilities not provided | Yes: Staff 2-8. |
| 20:10:22:12 | Alternative sites | | |
| 20:10:22:13 | Environmental information | 1. Irreversable changes not identified.  2. Environmental effects not calculated | 1. Yes: Staff 2-9. 2. No. |
| 20:10:22:14 | Effects of physical environment | Geological constraints are not discussed. | Yes: Staff 2-10. |
| 20:10:22:15 | Hydrology | 1. Map of water drainage not provided  2. Use of aquifers not discussed. | Yes. 1: Staff 2-11. 2: Staff 2-14. |
| 20:10:22:16 | Effects on terrestrial ecosystems | Breeding times and migration pathways not provided | Yes: Staff 2-15. |
| 20:10:22:17 | Effects on aquatic ecosystems | | |
| 20:10:22:18 | Land use | 1. The existence of certain land uses not clarified. 2. Number of displaced persons not provided. 3. Impact on farming not fully discussed. | Yes: 1: Staff 2-16. 2: 2-17. 3: 2-18. |
| 20:10:22:19 | Local land use controls | | |
| 20:10:22:20 | Water quality | | |
| 20:10:22:21 | Air quality | | |
| 20:10:22:22 | Time schedule | | |
| 20:10:22:23 | Community impact | Plans to coordinate with disaster services not discussed. | Yes : Staff 2-21 |
| 20:10:22:24 | Employment estimates | Job classifications not provided | Partially: Staff 2-22 and 2-23. (Job classifications for contractors and subcontractors not yet determined). |
| 20:10:22:25 | Future additions and modifications | | |
| 20:10:22:26 | Nature of proposed conversion facility | Consumption rate of materials not identified | Yes: Staff 2-24 and 2-25. |
| 20:10:22:27 | Products to be produced | | |
| 20:10:22:28 | Fuel type used | | |
| 20:10:22:29 | Proposed primary and secondary fuel and transportation | No map of transportation of fuel sources  Rail issues not discussed adequately. | Map: Yes: Staff 2-27. Rail issues: Partially: Staff 3-34 - 3-40 (these responses focus on current rail situation with Big Stone I). |
| 20:10:22:30 | Alternative energy sources | | |
| 20:10:22:31 | Solid or radioactive waste | | |
| 20:10:22:32 | Estimate of expected efficiency | Expected efficiency not calculated. | Yes: Staff 2-28. Rolfes Direct p. 23. |
| 20:10:22:33 | Decommissioning | Monetary cost of decommissioning not provided. | Yes: Staff 2-29. |
| 20:10:22:34 | Transmission facility layout and construction | Not Applicable | |
| 20:10:22:35 | Information concerning transmission facilities | Not Applicable | |
| 20:10:22:36 | Additional information in application | | |
| 20:10:22:37 | Statement required describing gas or liquid transmission line standards of construction | Not Applicable | |
| 20:10:22:38 | Gas or liquid transmission line description | Not Applicable | |
| 20:10:22:39 | Testimony and exhibits | Application does not "show the witnesses supporting the information contained in the application." | Witness names are contained in the Applicants' Direct Testimonies |
| 20:10:22:40 | Application for party status | Not Applicable | |

1

2

As seen from this table, the Applicants provided most of the missing details in discovery responses. However, certain important subjects have not been adequately addressed. First, the Application does not contain a calculation of environmental effects "to reveal and assess demonstrated or suspected hazards to the health and welfare of human, plant and animal communities..." as required by ARSD 20:10:22:13. Staff believes that such calculation should be in monetary terms, which would provide an appropriate point of comparison to the positive monetary impacts of the project on the community and state, for which the Applicants provided aggregate monetary measures.[3] Section III.D of this testimony contains Staff's own estimation of the environmental impact.

Second, neither the Application, nor the Applicants' direct testimonies provide a discussion of the current rail coal delivery problems – a discussion that would be appropriate under section ARSD 20:10:22:29 (transportation). Specifically, in its March 9, 2006, letter, Otter Tail Power Company notified the Commission that it is experiencing coal delivery issues. The letter explained that this problem is not unique to Otter Tail, that it started a year ago and has been escalating, and that because of these delivery problems Big Stone I's coal reserves are down.

Responding to the Commission's March 10, 2006, questions regarding the coal delivery problem, Otter Tail stated that the cause of the problem is the

---

[3] Application, Section 5.

1    delivery service of Burlington Northern Santa Fe Railways ("BNSF")[4] rather than

2    an issue with coal production or a deficit of railcars.[5] In its data response to

3    Staff,[6] the Applicants also referred to BNSF's presentation at the April 21, 2006,

4    SD PUC's Railroad Shipping Meeting where the railroad cited a 2005 supply

5    disruption and an unprecedented coal demand as two factors driving the coal

6    supply problems.[7] Otter Tail also explained that it has no legal options to force

7    BNSF's performance.[8]

8        Although Otter Tail used an emergency short-term contract with a

9    Montana mine to successfully replenish its stockpile by May 4, 2006,[9] (which

10   shortened rail distance) this option is not viable in the long-term because the

11   higher-sulfur content of Montana coal requires additional sulfur dioxide

12   allowances, making this option prohibitively expensive.[10] As an additional factor

13   in replenishing Big Stone I's coal supply, BNSF provided to Big Stone a

14   temporary third train, and currently Big Stone co-owners are in discussions with

15   the railroad to make this third train permanent.[11]

---

[4]   Note that BNSF provides the only rail line to Big Stone. The Applicants considered the absence
      of a competitive rail line as a disadvantage of Big Stone's site in their analysis of alternative sites.
      (See Direct Testimony of Mark Rolfes, p. 9.)

[11]  *Id.*

1    Otter Tail stated that according to BNSF, "fluidity will only return with

2    more track construction, which is a year or two away."[12] Although during the

3    April 21, 2006, SD PUC's Railroad Shipping Meeting BNSF did highlight its

4    extensive plans for capacity expansion, the presentation also indicated that the

5    demand for coal transportation will continue to grow. Specifically, BNSF's

6    presentation listed a total of 24 proposed coal-fired generation plants that will

7    require rail service in the Western United States and that are expected to start

8    operation between 2006 and 2012.[13] In other words, growth in demand for coal

9    transportation is going to continue, and it is not clear whether the BNSF's railroad

10   capacity expansion plans will solve the coal delivery problem by the time Big

11   Stone II becomes operational (which is 2011), or whether the coal delivery issue

12   will persist. It would also be desirable if the Applicants discussed whether the

13   presence of coal delivery problems would equally affect all alternative sites for

14   this project (ARSD 20:10:22:12), or whether the analysis of alternative sites

15   would result in a different site selection (different than Big Stone) if the coal

16   delivery problems were factored into the analysis.

17   Third, the future estimated consumer demand (ARSD 20:10:22:10) is not

18   adequately discussed. Specifically, the Application contains a verbal discussion

19   of the forecasting methods,[14] but does not provide the required "data, data

20   sources, assumptions, forecast methods or models" required by rule. Although a

---

[12]  Responses to March 10, 2006, PUC e-mail questions, Request No. 4.

[13]  BNSF Railway Presentation at SD PUC April 21, 2006 Meeting, slide 16. The last, twenty-fifth plant on this list does not have the year on-line listed, and as such, was not included in this count.

[14]  Section 3 of the Application.

1   significant amount of detail regarding forecasting models and data was provided

2   in responses to Interrogatories,[15] these responses do not provide for the

3   Commission a user-friendly and exhaustive summary of the forecast models and

4   data supporting the Application's demand estimates. For example, SMMPA's

5   Integrated Resource Plan[16] contains a detailed description of the econometric

6   models used to generate load forecasts. However, the specific forecast numbers

7   listed in this document are different when compared to the SMMPA's load

8   forecast presented in the Application,[17] suggesting that some of the data, inputs or

9   methods used to generate SMMPA's forecast presented in the Application are

10  different from the forecast documented in SMMPA's Integrated Resource Plan.

11  The Applicants, including SMMPA, did provide detailed information on

12  modeling in their recent responses to Staff's 3rd Set of Data Request. However,

13  due to the timing of these responses and the amount of supporting material (which

14  was often lacking adequate explanations about the organization and hierarchy

15  between different files), Staff was not able to finish its analysis of the Applicants'

16  demand models before filing this testimony.

17      Further, demand forecasts of some of the Applicants are inaccurate

18  because they do not properly account for Demand Side Management ("DSM")

19  programs. Specifically, both SMMPA and Otter Tail Power Company stated in

---

[15]  Specifically, in Responses to Intervenors' 1st Request for Production, Request No. 3 and more recently – in responses to Staff's 3rd Set of Data Requests, Requests Nos. 2, 8, 9, 17, 19, 24 and 28.

[16]  Provided in Responses to Intervenors' 1st Request for Production, Request No. 3.

[17]  Table 3-7 on p. 57 of the Application. Compare these numbers to the load forecast of SMMPA's Integrated Resource Plan provided in Responses to Intervenors' 1st Request for Production, Request No. 3. (Table IV-1, pp. IV-17 - IV-18).

7837

1    their responses to interrogatories that their DSM savings are not fully reflected in

2    their load demand forecasts presented in the Application.[18] Although GRE stated

3    that its "existing DSM programs" are accounted for in its forecast,[19] the relevance

4    of this statement is somewhat questionable because not only existing, but also

5    future DSM programs should be accounted for in a proper forecast. GRE's own

6    statements suggest that it is expanding its DSM programs: "GRE has consistently

7    been increasing its efforts with respect to ... DSM programs..."[20] and "GRE has

8    more than doubled spending on conservation programs from 2002 ... to 2004[,] as

9    well as nearly doubling the annual energy savings over the same time period."[21]

10   Note that GRE's load forecast[22] is made for a period starting in 2004. It is

11   reasonable to assume that this forecast was made based on data prior to 2004.[23] In

12   other words, the above referenced doubling of the DSM's effort between 2002

13   and 2004 is likely not captured in GRE's forecast.

14

15   ## B.    *Deliberate misstatements*

16   **Q.    DID YOU IDENTIFY ANY DELIBERATE MISSTATEMENTS BY THE**

17   **APPLICANTS?**

---

[18]   Responses to Intervenors' 1st Set of Interrogatories, Requests Nos. 16 and 17. According to Otter
Tail's response to request 16, its controllable load programs – the largest component of its DSM
programs – are not reflected in demand estimates, while other DSM programs are accounted for in
the forecast.

[19]   Responses to Intervenors' 1st Set of Interrogatories, Request No. 16.

[20]   Responses to Intervenors' 1st Set of Interrogatories, Request No. 15.

[21]   *Id.*

[22]   Table 3-4 on p. 50 of the Application.

[23]   Direct testimony of Richard R. Lancaster explains that GRE's forecast is based on historic usage
patterns and load factors (p. 16).

1    A.    No. Staff noticed a number of statements that are inconsistent with the supporting

2    material, but these inconsistencies may be stemming from the sheer amount of

3    application materials, the number of the Applicants' witnesses and/or the time

4    span over which the materials were filed. One example is the statement of the

5    Applicants' witness Mr. Skoglund regarding noise for the Big Stone II site. Mr.

6    Skoglund explained that although there are no quantitative standards in South

7    Dakota, the Applicants used Minnesota noise standards for reference purposes.

8    Mr. Skoglund explained that he prepared section 4.5.4 of the Application titled

9    "Noise." Further, Mr. Skoglund stated that Big Stone II will comply with

10    Minnesota noise standards.[24] A review of section 4.5.4 of the Application shows

11    that this statement is incorrect. The Application actually concludes "[i]ncreases

12    from Project are not predicted to cause *any new exceedances* of the reference

13    Minnesota noise standards."[25] The Application is referring to the fact that at two

14    out of the four noise monitoring sites in the Big Stone area, Minnesota noise

15    standards are currently violated (exceeded), and the additional noise from Big

16    Stone II, although increasing the total level of noise slightly, would not cause

17    noise violations at the other two sites – sites that currently comply with the

18    Minnesota noise standards. However, the Application does not conclude that Big

19    Stone II would comply with the Minnesota noise standards.

20          Another example is the Applicants' statements during the September 2005

21    public hearing about future mercury emissions. At the hearing, Mr. Grauman

---

[24]    Direct Testimony of Andrew J. Skoglund, p. 3.

[25]    Application, Section 4.5.4, p. 107. Emphasis added.

1   stated that "we will have sulfur dioxide, nitrogen oxide, and mercury emissions

2   from both units that are targeted to be less than or equal to Unit 1's emissions in

3   2004."[26] A similar statement was included in the Applicants' exhibits to the

4   hearing.[27] Following Commission Chairman Hanson's request at the hearing to

5   provide charts depicting emissions of several pollutants, the Applicants sent a

6   letter to the PUC containing such charts.[28] A chart for mercury showed total

7   emissions for Big Stone I and II at a level that is approximately two times higher

8   than 2004 emissions for Big Stone I. The chart did contain another data point

9   marked "BSP I and II Future Target," but the note to this data point explained that

10  this target is based on "South Dakota mercury allowance allocation under the

11  Clean Air Mercury Rule." Note that in his Direct testimony Mr. Grauman

12  testified that the Applicants "are uncertain if that goal can be reached given the

13  performance variability of mercury emission control measures."[29]

14          Further, Staff failed to find a discussion in the Application, Direct

15  testimony, the accompanying materials or discovery where the Applicants would

16  explain how they plan to achieve the mercury target that is lower than 2004 Big

17  Stone I's mercury emissions. It should be noted that the Applicants' testimony

18  does discuss briefly their participation in the ongoing research on mercury

---

[26]   Transcript of Proceedings, September 13, 2005, pp. 32-33.

[27]   The Applicants' Exhibit 1a, slide 17.

[28]   This October 10, 2005 letter was provided in response to Stueve 1st Request for Production of
       Documents/Interrogatories, Request No. 12.

[29]   Direct Testimony of Terry Grauman, p. 12.

1    reduction emissions.[30] However, it is unclear from this discussion whether this

2    research is expected to bring any concrete improvements in mercury emission

3    controls in the near future – improvements compared to the mercury emissions

4    rate assumed for Big Stone II.[31] As for the specific information, the Applicants'

5    *Prevention of Significant Deterioration Construction Permit Application* ("PSD

6    Permit Application")[32] mentions only one mercury emission rate – the rate set by

7    the Clean Air Mercury Rule. According to Staff's calculation,[33] this rate would

8    result in the level of mercury emissions for Big Stone I and II units that would be

9    approximately two times higher than Big Stone I 2004 emissions. In other words,

10   the Applicants' statement that mercury emissions are targeted to be less than

11   current mercury emissions is misleading because it is not supported by the record.

12

## C.    Compliance with all applicable laws and rules

14   Q.    WHAT EVIDENCE DID THE APPLICANTS PROVIDE TO SHOW THAT

15         THE FACILITY WILL COMPLY WITH ALL APPLICABLE LAWS AND

16         RULES?

---

[30]   *Id.,* p. 13.

[31]   Page 13 of Mr. Grauman's testimony states that testing of mercury controls at W.A. Parish 8 Unit brought "encouraging results." However, Mr. Grauman also explains that this unit is "equipped with emissions control equipment similar to what is proposed for Big Stone II Unit." In other words, the exact meaning of the phrase "encouraging results" is unclear: Do the test results simply confirm the expected emissions rate for Big Stone II (which is the mercury emissions rate required by federal regulations), or show a smaller emissions rate than the rate assumed for Big Stone II?

[32]   Application provided in response to Staff 1st Set of Data Requests, Request No. 5.

[33]   See Section III.C and Exhibit B to this testimony for details. These calculations produce the same results as Burns & McDonnell's calculations summarized in Responses to Staff's 3rd Set of Data Requests, Request No. 46.

1    A.    The Applicants stated that Big Stone II will comply with all local, state or federal

2          regulations and standards related to various aspects of Big Stone II construction

3          and operation such as hydrology,[34] water quality,[35] aquatic ecosystems,[36] landfill

4          and solid waste disposal,[37] air quality,[38] radioactive waste,[39] local regulations such

5          as zoning and building,[40] plant decommissioning,[41] and cultural resources.[42]

6                 The Application contained a list of the applicable potentially required

7          permits and approvals by project stage, agency and government level.[43] This list

8          was further updated in a data response to Staff,[44] where the Applicants indicated

9          the status of each permit. According to the updated list, a number of permit

10         applications had been filed with the appropriate agencies, including the PSD

11         Permit (Air Permit) and Solid Waste Disposal Permit Applications with South

12         Dakota DENR, Water Appropriation Permit Application with South Dakota

13         Water Rights Program, Transmission Route Permit Applications with the

14         Minnesota and South Dakota PUCs, and the certificate of need for the

15         transmission line with Minnesota PUC. It is Staff's understanding that on April

16         20, 2006, South Dakota DENR issued a public notice and a Statement of Basis for

1  draft PSD Permit for Big Stone II[45], and in May 2006 – draft Solid Waste Permit.

2  In addition, the Western Area Power Administration has issued a draft

3  Environmental Impact Statement for the project in May 2006.

4

5  Q.  **WILL BIG STONE II COMPLY WITH THE MERCURY EMISSION**

6  **STANDARDS?**

7  A.  The Applicants stated that Big Stone II will comply with the currently effective

8  standards of mercury emission per megawatt hour.[46] However, mercury emission

9  rules may change if and when the EPA finalizes its mercury cap-and-trade rules.

10  According to the EPA rules issued in March 2005, each state was given a certain

11  mercury emission budget – a budget expressed in physical units of annual

12  mercury emissions. Certain aspects of this rule, including the allocation of the

13  cap between states, have been challenged,[47] so that the budget allocated to South

14  Dakota under this rule cannot be considered final. Nevertheless, this budget

15  presents the best available estimate of the future cap, and the Applicants discuss

16  this budget in relation to Big Stone I and II's mercury emissions. Specifically,

17  they state that South Dakota's mercury budget, according to March 2005 EPA

18  rules, is 144 pounds per year starting in 2010, and it is reduced to 58 pounds per

19  year starting in 2018.[48] The Applicants also state that their goal is to reduce

20  mercury emissions to at least 144 pounds to avoid purchasing additional

[45]  Available at http://www.state.sd.us/denr/DES/AirQuality/aapubnot.htm.
[46]  Direct Testimony of David Gaige, p. 14.
[47]  http://www.epa.gov/air/mercuryrule/rule.htm#oct05a.
[48]  Direct Testimony of Terry Grauman, p. 12.

7843

1    allowances, but they "are uncertain if that goal can be reached given the

2    performance variability of mercury emission control measures."[49] Note that Big

3    Stone I and II are projected to emit approximately 400 pounds a year.[50] This

4    implies that in order to achieve the 2010 cap of 144 pounds, mercury emissions

5    should be reduced by more than two times, and in order to achieve the 2018 cap

6    of 58 pounds, the emissions should be reduced by more than six times. As

7    already discussed above, the Applicants are participating in research regarding

8    mercury emissions control.[51] Although the Applicants do not quantify the

9    expected results and timeline of this research, this research may bring

10   improvements to mercury emissions controls.

11

12   Q.    IS IT CORRECT THAT BURNS AND MCDONNELL'S PHASE I

13         REPORT ON BIG STONE II ASSUMED MERCURY-MITIGATION

14         TECHNOLOGY WITH LOWER MERCURY EMISSIONS THAN THE

15         CURRENT DESIGN OF BIG STONE II?

16   A.    Yes. The Phase I Report assumed activated carbon injection technology with the

17         mercury emission rate of .00002 lb/MWh,[52] which is approximately two times

---

[49]   *Id.*

[50]   This number is based on the chart "Big Stone I and II. Mercury" attached to the October 10, 2005,
       Applicants' letter to PUC. This chart was provided in response to Stueve 1st Request for
       Production of Documents/Interrogatories, Request No. 12. This number is consistent with Staff's
       own calculation of Big Stone II's mercury emissions at around 194 pounds annually (see Exhibit
       B to this testimony) and the Applicant's estimate of 2004 Big Stone I's mercury emissions at
       189.9 pounds provided in response to Stueve 1st Request for Production of
       Documents/Interrogatories, Request No. 13.

[51]   Direct Testimony of Terry Grauman, p. 13.

[52]   Exhibit 24-A to the Applicants' Direct Testimony, p. 2-4.

7844

1    less than the mercury emission EPA standard of 0.000042 lb/MWh adopted in the

2    current design of Big Stone II.  However, even with this technology, total

3    emissions from Big Stone I and II would likely exceed the future state budget.  In

4    other words, Big Stone Units I and II would have to purchase additional mercury

5    allowances.  Given the above quoted Applicants' statement about the performance

6    variability of mercury controls, it appears that other coal-fired plants that are

7    subject to the mercury cap would be facing similar difficulties.  In other words,

8    the price and availability of additional mercury allowances is a risk factor in Big

9    Stone II's ability to operate in compliance with mercury cap rules.

10

11   **D.    Environmental Impacts**

12   **Q.    WHAT EVIDENCE DID THE APPLICANTS PROVIDE IN ORDER TO**

13   **SHOW THAT BIG STONE II WILL NOT POSE A THREAT OF SERIOUS**

14   **INJURY TO THE ENVIRONMENT OR HEALTH OF THE**

15   **INHABITANTS IN THE SITING AREA?**

16   A.    The Applicants observed that because Big Stone II is to be constructed on a

17   brownfield, the environmental impact would be small.[53]  The Applicants stated

18   that Big Stone II will comply with all local, state and federal regulations and

19   standards related to various aspects of natural resources such as hydrology,[54]

20   water quality,[55] landfill and solid waste disposal,[56] and air quality.[57]

---

[53]    Direct Testimony of Raymond J. Wahle, p. 12.
[54]    Direct Testimony of Daniel Jones, p. 5.
[55]    *Id.* p. 9.

1    Specifically, the Applicants explained that South Dakota is currently an

2 attainment area in terms of the National Air Quality Ambient Standards,[58] and

3 that due to the Applicants' plan to install a control technology common with Big

4 Stone Unit I, Big Stone II will not increase plant-wide emissions of sulfur dioxide

5 and nitrogen oxides, thus not affecting air quality levels. They also explained that

6 according to air dispersion models, Big Stone II's emissions for particulate matter

7 and carbon monoxide would not result in a violation of federal air quality

8 standards for these pollutants.[59] During construction the Applicants plan to use

9 best management practices for soil erosion.[60] Further, the Applicants explained

10 that because of the zero liquid discharge design of Big Stone II, there will be no

11 notable changes in surface water quality, and the only notable alteration – the

12 makeup storage pond – will only alter the route of the drainage, but not the source

13 and discharge of surface waters.[61] The Applicants are working with USACE on

14 the mitigation plan to compensate for some of the wetlands that will be filled.[62]

15 The Applicants explained that the impact on fish population will be minimal

---

[56] Direct Testimony of Terry Grauman, p. 19.

[57] Direct Testimony of David Gaige, p. 2.

[58] These are standards set for six criteria pollutants – sulfur dioxide, nitrogen oxides, ozone, carbon dioxide, particulate matter and lead. See http://www.epa.gov/ttn/naaqs/.

[59] Direct Testimony of David Gaige, p. 13. Note that it is unclear whether and how the conclusion about non-violation of the national ambient quality standards for the two other criteria pollutants – ozone and lead – was made. The DENR's Statement of Basis for draft PSD Permit for Big Stone II explains that there is not EPA-approved model to model air dispersion and concentrations of ozone (p. 29). The same document explains that because lead is emitted as particulate matter, the Best Available Control Technology ("BACT") analysis (an analysis that does not establish compliance with the national air quality standards) for particulate matter also satisfies the BACT analysis for lead (p. 16).

[60] Direct Testimony of Daniel Jones, p. 7.

[61] *Id.*, pp. 3-4.

[62] *Id.*, pp. 11-12.

1    because there will be no discharge in the Whetstone River, and because the design

2    of the water intake will minimize entrainment of fish from Big Stone Lake.[63]

3

4    Q.    **DID THE APPLICANTS CONSIDER OTHER PATHWAYS THAT**

5          **AFFECT FISH POPULATION SUCH AS MERCURY AIR EMISSIONS?**

6    A.    Staff did not find such discussion in the documents presented in this case by the

7          Applicants. Staff believes that these effects should have been discussed.

8          Specifically, mercury air emissions eventually deposit into soils and water, and

9          build up in fish and animals that eat fish. Because mercury is known to harm

10         humans, especially unborn babies and small children,[64] many government

11         agencies and states issue guidelines regarding fish consumption. For example, the

12         state of South Dakota samples at least 10 lakes each year. Currently, fish

13         advisories are issued for five South Dakota lakes, including a lake in Day County,

14         which neighbors Grant County.[65] Minnesota issues statewide fish advisories, and

15         its current mercury advisory contains lakes in both counties that neighbor the Big

16         Stone plant – six lakes in Big Stone County, including Big Stone Lake, and Lac

17         Qui Parle Lake in Lac Qui Parle County.[66] Given that mercury emissions from

18         the combined operations of Big Stone I and II are projected to double compared to

7847

1  current Big Stone I emissions,[67] further contamination of local fish with mercury

2  is a concern.

3

4  **Q.    DID THE APPLICANTS CALCULATE THE ENVIRONMENTAL**

5  **EFFECTS TO ASSESS DEMONSTRATED OR SUSPECTED HAZARDS**

6  **TO HUMAN, PLANT AND ANIMAL COMMUNITIES AS REQUIRED BY**

7  **ARSD 20:10:22:13?**

8  A.    No, they did not.  Staff did not find this information in the application, the

9  Applicants' direct testimonies, their supporting exhibits, or discovery responses.

10  A party in this case, Ms. Stueve asked the Applicants to identify irreversible

11  changes and noted the requirement that the environmental effects shall be

12  calculated.[68]  In response, the Applicants stated that no irreversible changes are

13  expected, and that "[t]he environmental effects are described in Section 4 of the

14  Application."  Because a *description* of environmental effects does not meet the

15  requirement of *calculating* environmental effects, Staff asked the Applicants a

16  follow-up interrogatory to provide the required calculation.[69]  The responses to

17  this interrogatory are not expected before the filing date of this testimony;

18  therefore, Staff performed its own calculation of the environmental effects.

19

---

[67]    See for example, chart "Big Stone I and II. Mercury" attached to October 10, 2005 Applicants'
letter to PUC.  This chart was provided in response to Stueve 1st Request for Production of
Documents/Interrogatories, Request No. 12.

[68]    Stueve 1st Request for Production of Documents/Interrogatories, Request No. 26.

[69]    Staff 4th Data Request, Request No. 1.

1    Q.    PLEASE DESCRIBE YOUR GENERAL APPROACH TO THE

2          CALCULATION OF THE ENVIRONMENTAL EFFECTS OF BIG STONE

3          II.

4    A.    Environmental effects of coal-fired electric plants have been studied extensively.

5          Staff's starting point was the observation that the majority of environmental

6          effects for coal-fired plants come from air emissions.[70] Staff conducted a survey

7          of the existing environmental externality estimates per unit of air emission, and

8          applied them against Big Stone II's projected air emissions.

9

10   Q.    IS THE TERM "ENVIRONMENTAL EXTERNALITY" SYNONYMOUS

11         TO THE TERM "ENVIRONMENTAL IMPACT?"

12   A.    Strictly speaking, they are different, but close. An environmental externality is an

13         environmental impact that is not captured in the costs of the party that causes the

14         impact. This nuance is illustrated by the comparison of sulfur dioxide and

15         particulate emissions – two pollutants generated by coal-fired plants. Particulate

16         emissions are associated with numerous health effects, reduced visibility, negative

17         effects on vegetation and property damage from soiling.[71] These costs are not

18         borne by the owners of the plants, and thus, constitute an externality. Sulfur

19         dioxide emissions are also associated with negative environmental impacts such

---

[70]  For example, one study estimated that 90% of the environmental impact of coal fired plants was
      associated with air emissions, while land and water impacts accounted for the remaining 10%
      (Ottinger et al. *Environmental Cost of Electricity*. New York: Oceana Publications, 1990).
[71]  See for example, a review by EPA available at http://www.epa.gov/oar/airtrends/pm.html.

1   as respiratory health problems and acid rain.[72] But because coal-fired plants are

2   required to buy tradable allowances for sulfur dioxide emissions, these costs are

3   considered to be internalized by the plant owners (to the extent allowance prices

4   capture all adverse environmental impacts). In other words, sulfur dioxide

5   emissions create the environmental impacts, but not environmental externalities.

6   Many academic sources estimate environmental externality values for sulfur

7   dioxide, thus ignoring the existing "internalization" system of sulfur dioxide

8   tradable allowances. Such externality estimates provide a suitable source of

9   calculating environmental impacts. Further, as shown below, because of the

10  projected zero net emissions of sulfur dioxide, Big Stone II's environmental

11  impact from sulfur dioxide is zero. As a result, the difference between total

12  environmental effects and environmental externalities of Big Stone II is only

13  theoretical. Therefore, for the rest of this testimony Staff ignores the difference

14  between externality and environmental impact, and uses these terms

15  interchangeably.

16

17  Q.   PLEASE SUMMARIZE THE EXTERNALITY VALUES AND AIR

18       EMISSIONS USED IN YOUR ANALYSIS.

19  A.   Table 3 provides the list of pollutants, the range of externality values and Big

20       Stone II's projected annual emission levels used in the calculation of the

21       environmental impact.

22

---

[72]   See for example, a review by EPA available at http://www.epa.gov/oar/airtrends/sulfur.html.

| Pollutant | Externality Estimates (per ton of emission) | | | Big Stone II Annual Emissions (tons per year) |
|---|---|---|---|---|
| | Low | High | Year $ | |
| SO2 | $ 1,800 | $ 10,600 | 1999 | - |
| NOx | $ 2,200 | $ 16,900 | 1999 | - |
| CO | $ 700 | $ 2,900 | 1999 | 3,193 |
| PM10 | $ 2,000 | $ 26,500 | 1999 | 745 |
| VOC | $ 900 | $ 10,100 | 1999 | 85 |
| Lead | $ 472 | $ 526 | 2004 | 0.38 |
| Mercury | $ 5,000,000 | $ 73,300,000 | 1999 | 0.09 |
| CO2 -- Literature Survey | $ 1.5 | $ 51.0 | 1999 | 4,363,868 |
| CO2 -- CA PUC Adder | $ | 8.0 | 2005 | 4,363,868 |

Table 3. Big Stone II Annual Emissions and Externality Values Used to Calculate Big Stone II's Environmental Impact

The specific sources for the externality values and calculations used to generate

volumes in Table 3 are contained in Exhibit B to this testimony.

Q.     WHAT WAS THE SOURCE OF THE ANNUAL EMISSIONS VOLUMES?

A.     In general, the annual emissions were based on the Big Stone II's PSD Permit

Application adjusted as described in detail below.[73] The only two exceptions are

mercury and carbon dioxide for which emissions were calculated by using per

unit emission factors and plant operational parameters quoted in the Application

or the exhibits to Applicants' direct testimonies.

Staff made three adjustments to volumes listed in Big Stone II's PSD

Permit Application. The first adjustment was to account for the fact that the

volumes contained in the PSD Permit Application represent potential maximum

---

[73]   Application provided in response to Staff 1st Set of Data Requests, Request No. 5.

1    emissions – emissions associated with continuous operation of the plant

2    throughout the year. In order to convert potential maximum emissions to

3    "expected" emissions, Staff adjusted the potential maximum emissions downward

4    by the plant capacity factor.

5      The second adjustment was to account for the difference between the

6    proposed emission volumes (volumes contained in the Applicants' PSD Permit

7    Application) and the permitted volumes (volumes expected to be permitted under

8    the PSD Permit). Note that in April 2006 the South Dakota Department of

9    Environment and Natural Resources issued a Draft PSD Permit for Big Stone II

10    and a Statement of Basis associated with this Draft Permit. Although these

11    documents did not contain total annual permitted emissions amounts for each

12    pollutant (the draft permit is formulated in terms of emissions rates), Staff noticed

13    that in certain cases the Draft PSD Permit allowed for smaller total emissions than

14    the emission volumes listed in the PSD Permit Application. Specifically, the

15    Draft Permit contained smaller plant-wide permitted emissions of nitrogen oxides

16    and sulfur dioxide, as well as a smaller emission rate for carbon monoxide, than

17    the PSD Permit Application. In accordance with the Draft PSD Permit, Staff re-

1    calculated total annual emissions for these three pollutants.[74] The impact of this

2    adjustment is a reduction in annual emissions of these three pollutants.[75]

3         The third adjustment was to use a more accurate conversion factor

4    between pounds and tons. While performing its second adjustment to emission

5    volumes Staff noticed that the PSD Permit Application calculated total emission

6    volumes in terms of pounds, and then converted pounds to tons using a somewhat

7    rounded conversion factor.[76] Staff replaced this rounded conversion factor with a

8    more precise measure that Staff used elsewhere in its calculations.[77] The impact

9    of this adjustment is a small reduction in the annual tons of emissions.

10

11   Q.    **THE PSD PERMIT APPLICATION CONTAINS EMISSION VOLUMES**

12         **FOR TWO OTHER POLLUTANTS – SULFURIC ACID MIST AND**

13         **FLUORIDES. WHY DID YOU EXCLUDE THESE POLLUTANTS FROM**

14         **YOUR ANALYSIS?**

15   A.    Staff did not find externality estimates for these pollutants.

16

---

[74] This calculation is contained in Exhibit B. Staff conducted these calculations because first-hand information on total annual emissions was not available. However, it is unclear whether Staff's adjustments account for all the revisions to PSD Permit Applications, for example, revisions mentioned in the Statement of Basis on page 1. If more accurate information on total annual emissions becomes available, Staff would revise its environmental impact calculations accordingly.

[75] Because the plant-wide Big Stone Units I and II permitted emissions for sulfur dioxide and nitrogen oxides are set equal to historical emissions of Big Stone I, the effective emissions of these two pollutants associated with Big Stone II are zero.

[76] Calculations on pages 3-3 and 3-4 of PSD Permit Application imply a conversion factor of 0.0005 lb/ton.

[77] This conversion factor is approximately 0.0004536 lb/ton.

1    Q.    PLEASE EXPLAIN WHY YOUR EXTERNALITY ESTIMATES ARE

2          REPRESENTED AS A WIDE RANGE OF VALUES.

3    A.    The wide range simply captures the uncertainties associated with estimating

4          externalities.  One source of such uncertainties is the need to assign monetary

5          values to non-market goods, such as the value of human life or health.  Another

6          factor is the uncertainty about the dose-response functions – the physical

7          relationship between specific levels of exposure to pollution and the resulting

8          physical effects such as an asthma attack or cancer.  An EPA's survey of

9          externality studies[78] found that these two factors contribute significantly more to

10         the variability of externality estimates than the third factor – regional-specific

11         parameters such as population density, ambient air quality or the presence of

12         fragile ecosystems.  Because of these uncertainties it is customary in the

13         externality literature to conduct an aggregation analysis – derive a range of

14         externality values from a number of surveyed sources.  The above mentioned

15         EPA survey contains such aggregation analysis.  Staff used this EPA survey as its

16         main source of the externality values.

17

18   Q.    WHAT WERE THE OTHER SOURCES OF YOUR EXTERNALITY

19         VALUES?

20   A.    The EPA survey did not contain externality values for lead and mercury.  For

21         each of these two pollutants Staff identified only one source of externality

---

[78]   Available at www.epa.gov/oppt/epp/pubs/guidance/top20faqexterchart.htm.

1    estimates. For mercury this source was a recent paper by *Resources for the*

2    *Future*,[79] and for lead – Minnesota PUC's prescribed externality values.

3    In addition, because the EPA's externality estimates for carbon dioxide

4    exhibited the widest range compared to other pollutants,[80] Staff utilized two

5    alternative estimates for externalities associated with carbon dioxide – one was

6    the estimate from the EPA survey, and the other – the externality adder used by

7    the California PUC.[81] Staff believes that the use of two alternative externality

8    estimates for carbon dioxide was appropriate for two reasons. First, as will be

9    shown below, due to the large volumes of carbon dioxide emissions, the

10   environmental impacts of carbon dioxide constitute a significant portion of total

11   impact. Second, although scientists agree that carbon dioxide creates adverse

12   effects on the environment by attributing to global warming, the specific adverse

13   effects of carbon dioxide on the environment are less understood than the effects

14   of criteria pollutants such as sulfur dioxide or particulate matter.[82] For example,

15   the EPA's Global Warming site explains

---

[79]  Palmer K., Butraw D. and Shih S.-J. *Reducing Emissions from the Electricity Sector*, Discussion paper, June 2005.

[80]  The ratio of upper and lower values was 34, or 3,400%.

[81]  The choice of California PUC's value was not based on any formal analysis, but rather as an example of a mid-range value. For example, California's externality value of $8 per ton of carbon dioxide emission is higher than Minnesota PUC's values of $3.64 within Minnesota, and zero within 200 miles of Minnesota. Another example is Oregon, where the PUC requires utilities to conduct scenario analysis with carbon dioxide externality values of zero, $10, $25 and $40. In their latest integrated resource plans one Oregon utility adopted a base-case scenario externality value of approximately $8, another utility adopted a base-case value of $12 per ton of carbon dioxide, and a third utility adopted two alternative base-case scenarios of zero and $10. (Information provided by Oregon PUC Staff.)

[82]  Criteria pollutants include $SO_2$, $NO_x$, CO, PM, Lead and Ozone. Ozone is formed by a reaction between $NO_x$ and Volatile Organic Compounds (VOC). In other words, Staff's analysis includes the effects of criteria pollutants plus mercury and carbon dioxide.

1          Figuring out to what extent the human-induced accumulation of

2          greenhouse gases since pre-industrial times is responsible for the global

3          warming trend is not easy. This is because other factors, both natural

4          and human, affect our planet's temperature. Scientific understanding of

5          these other factors – most notably natural climatic variations, changes in

6          the sun's energy, and the cooling effects of pollutant aerosols – remains

7          incomplete.[83]

8    Because of the controversy surrounding the quantification of environmental

9    impacts of carbon dioxide Staff not only utilized two alternative externality

10   estimates for carbon dioxide, but also presented the results of its calculation by

11   explicitly separating the impact of carbon dioxide.

12

13   **Q.**    **DO THE EXTERNALITY VALUES USED IN YOUR ANALYSIS**

14        **REPRESENT THE IMPACT SPECIFIC TO SOUTH DAKOTA?**

15   **A.**    No, they do not. By nature, air emissions are not confined to state boundaries,

16       especially in the case of Big Stone II, which is located on the Minnesota border.

17       In fact, most of the air emissions in question have a regional, rather than local

18       nature in the sense that they are often transported hundreds of miles away from

19       the source. For example, acid rain (which results from the emissions of nitrogen

20       oxides and sulfur dioxide) may be carried by winds across state or national

21       borders before it falls on the ground. It is estimated that at least 75% of the

22       emitted mercury will likely be transported more that 50 km[84] from the emission

23       source, and a significant portion would be vertically diffused into free atmosphere

---

[83]   http://yosemite.epa.gov/oar/globalwarming.nsf/content/climateuncertainties.html.

[84]   Thirty one miles. EPA *Mercury Study. Report to Congress. Volume III: Fate and Transport of Mercury in the Environment.* December 1997.

1  to become part of the global cycle.[85]  Particulate matter has both local and

2  regional nature, where large particles are deposited locally, and fine particles can

3  be transported thousands of miles away from the source.[86]  And finally, the

4  greenhouse effect of carbon dioxide is global by nature, so that the adverse effects

5  of global warming may show in areas unrelated to the emission sources of carbon

6  dioxide.

7

8  Q.  THE APPLICANTS' PSD PERMIT APPLICATION ESTIMATES THAT

9  BIG STONE II WILL NOT CAUSE A VIOLATION OF THE NATIONAL

10  AMBIENT AIR QUALITY STANDARDS IN GRANT COUNTY.  DOES

11  THE NON-VIOLATION OF THE STANDARDS IMPLY THAT THE

12  ENVIRONMENTAL IMPACTS ARE ZERO?

13  A.  No, it does not.  As explained above, air emissions are often transported hundreds

14  of miles away, thus contributing to air pollution in other areas.  The negative

15  impact of mercury emissions (to which the national ambient air quality standards

16  do not apply[87]) is associated with its accumulation in fish, and as discussed above,

17  fish in certain lakes in South Dakota and the two Minnesota counties neighboring

18  Big Stone is already considered to be unsafe by state health departments.

---

[85]  *Id.*

[86]  http://www.epa.gov/airtrends/pmreport03/pmunderstand_2405.pdf#page=1. Note that particulate matter from Big Stone II (PM10) defined as particles with diameter less or equal to 10 micrometers includes both fine particles (particles with diameter less or equal to 2.5 micrometers) and coarse particles (particles with diameter greater 2.5 micrometers).

[87]  The national ambient air quality standards are set for six criteria pollutants discussed above. See for example, http://www.epa.gov/ttn/naaqs/.

7857

1      Of course, it is reasonable to expect that emissions that deposit locally or

2  regionally cause larger environmental impacts in areas where the air quality is low

3  compared to areas where the air quality is high. It is also important to keep in

4  mind that externality studies are often conducted for more densely populated

5  areas than the Big Stone area and the surrounding states. Therefore, Staff's

6  calculation of the environmental impacts should be considered as a "pessimistic

7  scenario" rather than an "average scenario." Based on the same reasoning, the

8  lower boundary of externality values listed in Table 3 may be more relevant to the

9  proper estimation of environmental impact of Big Stone II than the upper

10  boundary. However, Staff utilized both lower and upper values of externalities in

11  its calculation because, as explained above, the variance in externality estimates is

12  caused not only by regional factors, but also by uncertainty related to the value of

13  non-monetary goods such as human life and the exact physical dose-response

14  relationships.

15

16  Q.  PLEASE  SUMMARIZE  YOUR  CALCULATION  OF  THE

17  ENVIRONMENTAL IMPACTS OF BIG STONE II.

18  A.  Table 4 contains Staff's estimate of the annual environmental impact associated

19  with air emissions by Big Stone II.[88]

---

[88]  For calculations, see Staff's Exhibit B.

7858

Table 4. Big Stone II Annual Environmental Impact Estimates (2005 Dollars)

| Pollutant | Big Stone II Environmental Impact Estimates | | |
| --- | --- | --- | --- |
| | Low | High | Average |
| SO2 | $ - | $ - | $ - |
| NOx | $ - | $ - | $ - |
| CO | $ 2,561,019 | $ 10,609,935 | $ 6,585,477 |
| PM10 | $ 1,706,836 | $ 22,615,578 | $ 12,161,207 |
| VOC | $ 87,401 | $ 980,833 | $ 534,117 |
| Lead | $ 183 | $ 204 | $ 194 |
| Mercury | $ 504,855 | $ 7,401,175 | $ 3,953,015 |
| Total Excluding CO2 | $ 4,860,294 | $ 41,607,726 | $ 23,234,010 |
| CO2 -- Literature Survey | $ 7,500,704 | $ 255,023,933 | $ 131,262,318 |
| CO2 -- CA PUC Adders | $ 34,910,940 | $ 34,910,940 | $ 34,910,940 |
| Total: CO2 Based on Literature | $ 12,360,998 | $ 296,631,659 | $ 154,496,328 |
| Total: CO2 Based on CA PUC | $ 39,771,235 | $ 76,518,666 | $ 58,144,950 |

The total annual impact is calculated as a product of Big Stone II's annual

emissions, and the low and high externality values. As the table shows, carbon

dioxide's contribution to the total impact is by far the largest: Under the

externality values from the EPA literature survey, carbon dioxide constitutes on

average 85% of the total environmental impact.[89] Under the carbon dioxide's

externality adder used by the California PUC, carbon dioxide's share in total

impact is 60%.[90] The total impact ranges between approximately $12 and $300

million if we use the carbon dioxide externality values from literature, and

between $40 and $77 million if we use the California PUC's externality adder for

---

[89] Calculated as $131,262,318 / $154,496,328.

[90] Calculated as $34,910,940 / $58,144,950.

1   carbon dioxide. The two other pollutants that contribute significantly to the total

2   impact are carbon monoxide and particulate matter.

3

4   Q.   THE ESTIMATED ENVIRONMENTAL IMPACTS APPEAR TO BE

5        LARGE. WHAT IS THE PROPER CONTEXT FOR THE ESTIMATED

6        ENVIRONMENTAL IMPACTS THAT WOULD HELP THE

7        COMMISSION IN ITS DECISION-MAKING?

8   A.   The proper context for the environmental effects – which are negative

9        "external"[91] effects of Big Stone II to society and the environment – is to compare

10       them to the positive socio-economic effects of Big Stone II. The Applicants

11       quantified two sources of the positive socio-economic effects of Big Stone II:

12       First, the Applicants estimated the direct, indirect and induced economic impacts

13       of Big Stone II construction and operation to the state of South Dakota (the

14       multiplier analysis).[92] Second, the Applicants estimate additional state and local

15       property, sales, use and excise tax effects.[93] Although the socio-economic impact

16       is calculated for a more limited geographic region (state of South Dakota), it

17       nevertheless provides a useful reference point. At the same time it is important to

18       keep in mind that because of this geographic "mismatch," the positive impacts, as

19       well as the net impacts (the difference between positive and negative impacts) are

20       likely to be underestimated. In addition, the Applicants' estimate for socio-

---

[91]   These effects are "external" in the sense that they are borne by entities other than the Applicants.
[92]   Direct Testimony of Randall M. Stuefen and Exhibit C of the Application.
[93]   Direct Testimony of Janelle Johnson and Application Section 5.1.5.

1    economic benefits does not include "primary" consumer benefits of the project

2    associated with the production of electricity.[94] Again, this is another factor that

3    makes Staff's analysis a "pessimistic" scenario.

4

5 ·  **Q.   HOW DID YOU COMPARE ENVIRONMENTAL AND SOCIO-**

6    **ECONOMIC EFFECTS GIVEN THAT THE LATTER VARY BY YEAR?**

7    A.   The socio-economic impact does vary significantly between the phases of

8    construction and operation. For example, the Applicants estimate[95] that the

9    economic impact of the four-year construction is between $745.1 and $810.4

10    million,[96] while the annual economic impact of operation is $3.6 million.[97]

11    Similarly, sales taxes during construction are estimated as $11 million,[98] and as

12    "materially insignificant"[99] during operation.

---

[94]    These benefits – referred to as consumer surplus in economic textbooks – are associated with the
positive difference between the consumers' willingness to pay of electricity and the marker price
of electricity.

[95]    The estimates of the economic impact quoted in this testimony are based on the Applicants' direct
testimony. The Applicants' response to Staff's discovery (Staff's 3rd Set of Data Requests,
Request No. 48) indicates that the economic impacts should be revised downwards to exclude
social security contributions. In this data response the Applicants provided a revised estimate for
one of the measures of the impact, which was lowered by 6.2% (social security contributions)
compared to the estimate filed in the testimony. Unfortunately, the data response did not contain
the revisions for all estimated impacts. The data response also did not explain whether any other
measures of the economic impact should be revised; therefore, Staff's summary of the economic
impact does not capture this revision.

[96]    Direct Testimony of Randall M. Stuefen p. 8 (2008 dollars) and Exhibit 26-B, Summary Table 4.
The Applicants calculated the lower boundary as the economic impact without escalation money
(money budgeted to account for inflation and cost over-runs), and the upper boundary – as the
economic impact with escalation money.

[97]    Direct Testimony of Randall M. Stuefen p. 8.

[98]    Direct Testimony of Janelle Johnson, p. 5.

[99]    Id., p. 6.

1      Note that the estimated environmental impact is associated with the

2   operation stage of the plant, therefore, in order to compare socio-economic and

3   environmental effects of Big Stone II, it is necessary to express them in

4   comparable measures – present values of the future streams of annual effects. In

5   addition, all of the dollar figures need to be converted into "real" dollars – dollars

6   of the same base year. Staff performed this calculation for the whole operation

7   life of the plant, which was assumed to be 40 years.[100] In addition, Staff had to

8   make an assumption about the annual discount rate, which was set to 10% in

9   Staff's base case scenario. Later in this testimony I discuss the basis for this

10  assumption and the sensitivity of the results to alternative discount rates.

11      Table 5 below lists the economic impacts presented in the Applicants'

12  testimony. The annual economic impacts are converted into present value real

13  dollars in the last row of this table.

---

[100]  This assumption is based on the Applicants' statements that the plant is designed for a 30-year
minimum operation life, and that it is common for solid fossil fuel plants to operate beyond their
projected minimum lives (See Section 2.1.3 of the Application).

Table 5. Big Stone II's Annual and Total Economic and Tax Impacts Present Value Calculated over Life of the Plant (2005 dollars).

| Time Period | SD Economic Impact* | | Property Tax Impact** | Sales, Use, Excise Tax Impact** | Total Impact | |
| | Without Escalation $ | With Escalation $ | | | Min | Max |
|---|---|---|---|---|---|---|
| Total Construction (4/07-4/11) | $ 745,145,207 | $ 810,376,070 | | $11,000,000 | | |
| Construction year 1 | | | $ 560,000 | | | |
| Construction year 2 | | | $ 1,100,000 | | | |
| Construction year 3 | | | $ 1,600,000 | | | |
| Construction year 4 | | | $ 1,600,000 | | | |
| Annual Operation | $ 3,600,000 | $ 3,600,000 | $ 4,700,000 | insignificant | | |
| Present Value over Life of the Plant*** | $579,285,084 | $628,012,199 | $35,105,456 | $8,717,130 | $623,107,670 | $671,834,785 |

\* – Source: Stuefen's Direct Testimony, Exhibit 26-B Table 4 (2008 dollars)

\*\* – Source: Johnson's Direct Testimony (year for dollar figuers was not specified; Staff assumed year 2005)

\*\*\* – Based on 40-year plant life and 10% discount rate

As seen from Table 5, the present value of economic and tax impacts over the life of the plant is estimated to be between $623,107,670 and $671,834,785. This range represents the comparison point to Staff's estimates of the negative environmental impacts.

**Q.    PLEASE PROVIDE THE COMPARISON OF SOCIO-ECONOMIC BENEFITS AND NEGATIVE ENVIRONMENTAL IMPACTS OF BIG STONE II.**

The results of Staff's calculations are presented in Table 6A. [101]

---

[101]    For calculations, see Staff's Exhibit B.

| Table 6A. Comparison of Negative Environmental and Positive Local Impacts of Big Stone II. CO2 Externalities Based on Literature Values. 10% Discount Rate. Present Value over 40-year Life of the Plant (2005 dollars). | | | |
|---|---|---|---|
| Measure | Lower Boundary | Upper Boundary | Average |
| I. Negative Impact: Externalities from Pollution (No geographic boundaries defined) | | | |
| Total Externalities Including CO2 | $ 82,561,866 | $ 1,981,269,062 | $ 1,031,915,464 |
| Total Externalities Excluding CO2 | $ 32,462,990 | $ 277,907,289 | $ 155,185,139 |
| II. Positive Impact: Local Economic and Tax Effects (State of South Dakota) | | | |
| Total Impact | $623,107,670 | $671,834,785 | $ 647,471,227 |
| III. Net Impact | | | |
| Net Impact Including CO2 | $ (1,358,161,392) | $ 589,272,919 | $ (384,444,236) |
| Net Impact Excluding CO2 | $ 345,200,381 | $ 639,371,795 | $ 492,286,088 |

\* – Lower Boundary of Net Impact = Lower Boundary of Positive Impact - Upper Boundary of Negative Impact. Similarly, Upper Boundary of Net Impact = Upper Boundary of Positive Impact - Lower Boundary of Negative Impact

**Q. WHAT ARE THE MAIN CONCLUSIONS FROM THIS TABLE?**

A. Staff made three main conclusions. First, if we account for the negative impacts of all pollutants including carbon dioxide, for which the EPA literature survey gives a wide range of externality values, the net impact of Big Stone II lies in a wide range between negative $1.4 billion and positive $0.6 billion, and averaging negative $0.4 billion.[102] This result is shown in Table 6A. As seen from the row titled "Net Impact Excluding $CO_2$," the negative net impact is driven by the presence of externality effects associated with carbon dioxide: If we exclude carbon dioxide externalities, the total net impact of Big Stone II is positive.

Second, if we adopt a moderate level of the carbon dioxide's externality value, such as the adder used by the California PUC, the net impact of Big Stone II is positive. This result is shown in Table 6B, which represents a variation of

---

[102] Values from the second to last row of Table 6A.

1    Table 6A, with the only difference being the externality value for carbon dioxide

2    utilized in the calculations:

**Table 6B. Comparison of Negative Environmental and Positive Local Impacts of Big Stone II. CO2 Externalities Based on Literature Values. 10% Discount Rate. Present Value over 40-year Life of the Plant (2005 dollars).**                      *CA PUC*

| Measure | Lower Boundary | Upper Boundary | Average |
|---|---|---|---|
| I. Negative Impact: Externalities from Pollution (No geographic boundaries defined) | | | |
| Total Externalities Including CO2 | $ 265,640,954 | $ 511,085,253 | $ 388,363,103 |
| Total Externalities Excluding CO2 | $ 32,462,990 | $ 277,907,289 | $ 155,185,139 |
| II. Positive Impact: Local Economic and Tax Effects (State of South Dakota) | | | |
| Total Impact | $623,107,670 | $671,834,785 | $ 647,471,227 |
| III. Net Impact* | | | |
| Net Impact Including CO2 | $ 112,022,417 | $ 406,193,831 | $ 259,108,124 |
| Net Impact Excluding CO2 | $ 345,200,381 | $ 639,371,795 | $ 492,286,088 |

*\* – Lower Boundary of Net Impact = Lower Boundary of Positive Impact - Upper Boundary of Negative Impact.*

3    *Similarly, Upper Boundary of Net Impact = Upper Boundary of Positive Impact - Lower Boundary of Negative Impact*

4

5    As seen from Table 6B, the net impact of Big Stone II is positive if we "price" the

6    impact of carbon dioxide at the level used by the California PUC. In other words,

7    under the moderate level of the carbon dioxide's externality value the geographic

8    mismatch between the estimated "global" environmental impacts and "state-wide"

9    socio-economic effects does not affect the overall conclusion that Big Stone II's

10   socio-economic benefits exceed its environmental costs.

11       Third, if we narrow down the environmental impacts to the state of South

12   Dakota, the net impact of Big Stone II is likely to be positive: It is reasonable to

13   assume that South Dakota's share of the adverse effect of carbon dioxide (which

1     is global warming) is very small. As already noted, if we exclude the effect of

2     carbon dioxide, the net impact of Big Stone II becomes positive.[103]

3

4    **Q.  PLEASE EXPLAIN YOUR BASIS FOR THE ASSUMED DISCOUNT**

5    **RATE AND COMMENT ON THE SENSITIVITY OF THE RESULTS TO**

6    **CHANGES IN THIS ASSUMPTION.**

7    A.  Recall that a discount rate is a measure of the trade-off between present and future

8     cash flows. As noted above, Staff's base case scenario assumes a 10% discount

9     rate. This value is designed to be a round number that approximates a discount

10    rate of the private industry, which is typically measured as expected returns on

11    investment.[104] However, the issue of choosing the appropriate discount rate is

12    controversial when the study involves environmental impacts. Some researchers

13    believe that in utility planning private discount rates should be used for the sake

14    of consistency.[105] Others believe that the discount rate should be low (or even

15    zero) because environmental impacts involve health effects and future

16    generations, and it is inappropriate to discount health and well-being of future

17    generations.[106] The EPA uses alternative discount rates in its cost-benefit

---

[103]  This result holds even if we assume that South Dakota's share of the adverse effects of carbon dioxide (as calculated in Table 6A, i.e. under carbon dioxide's externality values from the EPA literature) is 20%.

[104]  In regulated industries the expected returns on private investment are reflected in the calculated weighted cost of capital. According to the Analysis of the Baseload Generation Alternatives (the Applicants' Exhibit 23-A, pages 5-5 – 5-6), the weighted cost of capital (and the discount rate) of an investor owned utility was assumed to be 9.75%.

[105]  Chernick, P. and E. Caverhill, The Valuation of Externalities from Energy Production, Delivery and Use, Boston, Massachusetts, 1989.

[106]  Pearce, D. and R. Turner. Economics of Natural Resources and the Environment, Harvester-Wheatsheaf, 1990.

1  analysis, which are currently set at 3% for the "social discount rate" and 7% for

2  the "opportunity cost of capital."[107]

3      Staff adopted the EPA's discount rate of 3% to test the sensitivity of its

4  analysis that compares environmental costs and economic benefits of the Big

5  Stone II project. Table 7A below represents a version of Table 6A (Staff's base

6  case) with only one difference – the discount rate was changed from 10% to 3%.

Table 7A. Comparison of Negative Environmental and Positive Local Impacts of Big Stone II. CO2 Externalities Based on Literature Values. 3% Discount Rate. Present Value over 40-year Life of the Plant (2005 dollars).

| Measure | Lower Boundary | Upper Boundary | Average |
|---|---|---|---|
| I. Negative Impact: Externalities from Pollution (No geographic boundaries defined) | | | |
| Total Externalities Including CO2 | $ 253,859,988 | $ 6,091,976,435 | $ 3,172,918,211 |
| Total Externalities Excluding CO2 | $ 99,816,715 | $ 854,505,169 | $ 477,160,942 |
| II. Positive Impact: Local Economic and Tax Effects (State of South Dakota) | | | |
| Total Impact | $833,616,799 | $890,755,970 | $ 862,186,384 |
| III. Net Impact | | | |
| Net Impact Including CO2 | $ (5,258,359,636) | $ 636,895,982 | $ (2,310,731,827) |
| Net Impact Excluding CO2 | $ (20,888,370) | $ 790,939,254 | $ 385,025,442 |

* – Lower Boundary of Net Impact = Lower Boundary of Positive Impact - Upper Boundary of Negative Impact. Similarly, Upper Boundary of Net Impact = Upper Boundary of Positive Impact - Lower Boundary of Negative Impact

9      As seen from Table 7A, the decrease in the discount rate significantly decreased

10  the net impact: For example, the average total net impact (including the impact of

11  carbon dioxide) decreased from negative $0.4 billion in Table 6A to negative $2.3

12  billion in Table 7A. Similarly, the average net impact excluding carbon dioxide

13  also decreased – from positive $0.5 billion to positive $0.4 billion. At the same

---

[107] See for example, EPA "Regulatory Impact Analysis for the Final Clean Air Visibility Rule or the Guidelines for Best Available Retrofit Technology (BART) Determinations Under the Regional Haze Regulations," June 2005, page 4-5, footnote 17.

1　time the upper boundary of the net impact increased. For example, the upper

2　boundary for the net impact excluding carbon dioxide increased from positive

3　$0.6 billion to positive $0.8 billion.

4　　　Although the average net impacts appear to be unfavorable to the

5　Applicants, the fact that the upper boundary of the estimated net impact remains

6　to be positive is significant: As explained above, because of the "generic" nature

7　of the externality values used in Staff's calculation and the fact that South Dakota

8　is likely to be a "cleaner" and less densely populated state than a typical area

9　where externality studies were performed, the upper boundary of the net impact[108]

10　is likely to be a more accurate estimate of Big Stone II's net impacts than the

11　lower boundary. It is also important to re-iterate that the positive economic

12　impact estimated by the Applicants and utilized in Staff's calculations does not

13　account for "primary" consumer benefits of the project – consumer surplus from

14　the production of electricity.

15

16　**Q. ARE THERE ANY OTHER LIMITATIONS OF YOUR ANALYSIS**

17　**BESIDES THE ALREADY DISCUSSED LIMITATIONS?**

18　A. Yes. Staff's estimates of the environmental impacts are based on the key air

19　emissions, and do not account for other natural resource uses such as land and

20　water. As mentioned above, land and water impacts are expected to be

21　significantly less than air impacts; nevertheless, they are likely to be present. For

---

[108]　Because the environmental impact represents cost rather than benefits, the upper boundary of the net impact is calculated using the lower boundary of the environmental impact.

1  example, the project is expected to permanently take out of production 465 acres

2  of prime farmland, which is 0.17% of the prime farmland in Grant County as

3  discussed later in the testimony.[109] The negative impact to farming, which is

4  expected to be small, is not captured in the analysis above. Another effect that is

5  not accounted for is the impact of Big Stone II's project on the tourism industry,

6  where a small displacement of traditional users is likely to happen. The effect on

7  the tourist industry is analyzed in the testimony of Staff's witness Dr. Madden.

8

## E.  Community Impact

9

10  Q.  **WHAT IS THE MAIN SOURCE OF THE POTENTIAL NEGATIVE**

11  **COMMUNITY IMPACTS OF THE PROJECT?**

12  A.  The potential negative impact on the community is associated mainly with the

13  substantial influx of people in the area during construction. Specifically, the

14  Applicants estimated that at its peak, Big Stone II's construction will employ

15  1,400 workers, which, counting the family members, may bring approximately

16  3,556 people into the area.[110] This number constitutes 11% of the total population

17  of the four-county local area.[111] Although the Applicants cite the construction of

---

[109]  Responses to Staff's 2nd Discovery, Request No. 18.

[110]  Application, Table 5-3, pp. 128-129. Note this estimate may be over-stating the total influx of people because it does not account for the possibility that some of the new workers would be local residents. It also assumes that construction workers will typically bring their families, while the evidence collected by the Local Review Committee from the currently built Weston 4 power plant in Wisconsin shows that few employees brought their children with them. (*Big Stone II Final Report on the Social and Economic Assessment*, December 14, 2005 ("Report of the Local Review Committee"), p. 13).

[111]  Based on the population counts by county contained in Application, Table 5-3, pp. 128-129.

1    Big Stone I as an example where the local community successfully

2    accommodated the influx of people, it is worth noting that during Big Stone I

3    construction, the number of construction workers was smaller at 900 people.[112]

4        As discussed in Exhibit 4 of the Application, an influx of people

5    stimulates demand for lodging, medical care, schools and other sectors of the

6    local economy, which can strain a small rural economy.[113] Because of the rural

7    character of the Big Stone area, this site received the lowest "socio-economic"

8    score in the Applicant's analysis of alternative sites.[114]

9

10   Q.   **WHAT SPECIFIC NEGATIVE IMPACTS OF THE INFLUX OF PEOPLE**

11        **DURING CONSTRUCTION HAVE YOU IDENTIFIED?**

12   A.   Staff identified two areas where the negative impact is expected to be most

13        noticeable: housing and law enforcement. The Applicants contracted the First

14        District Association of Local Governments[115] ("First District") to conduct a

15        community survey, including a study of the availability of temporary lodging,

16        including motels and rental properties such as houses, apartments, mobile homes

17        and mobile home pads. According to their survey, there are 2,242 motel beds in

18        the 60-miles radius area around Big Stone,[116] and motels will be able to

---

[112]  Application, p. 116.
[113]  Application, Exhibit 4, pages 4-5 – 4-6.
[114]  *Id.*
[115]  The results of this survey are described in the direct testimony of Mr. Dick Edenstrom, who is the executive director of this association.
[116]  Application, p. 120.

1    accommodate 1,121 workers and still conduct business as usual.[117] Although the

2    general conclusion of the First District study was that the affected communities

3    are capable and willing to absorb the housing needs of the project,[118] certain

4    negative effects may be expected. For example, the Application mentions that

5    seasonal availability of the motels may be an issue.[119] Given that the Application

6    also mentions long-term arrangements for large blocks of rooms, it is reasonable

7    to conclude that the seasonal shortage of motel beds may be an issue for other

8    visitors to the area, rather than the Big Stone II's construction workers (who

9    would likely have long-term arrangements). In other words, some seasonal

10    business such as from the tourist industry may be lost during the years of

11    construction.

12    The Local Review Committee pointed to another area where the housing

13    market may be adversely affected by the temporary influx of construction workers

14    – the upwards pressure on housing prices and that housing may cease being

15    affordable to some local residents. Specifically, the Local Review Committee

16    noted that the existing housing base within Grant and Big Stone counties is only

17    6,500 units;[120] that local developers have already started purchasing rental

18    property;[121] and that lot rents have already increased.[122] The Local Review

19    Committee suggested not only a housing contingency plan be developed by the

---

[117] Direct Testimony of Dick Edenstrom, p. 9.
[118] *Id.*, p. 3.
[119] Application, p. 120.
[120] Report of the Local Review Committee, p. 11.
[121] *Id.*, p. 9.
[122] *Id.*, p. 10.

1   Big Stone owners (in case the local housing market cannot accommodate

2   additional workforce),[123] but also that rent assistance be provided by the South

3   Dakota Housing Development Authority in cases of sudden rate hikes.[124] Note

4   that the Applicants stated that they plan to follow the recommendations of the

5   Local Review Committee and develop a housing contingency plan.[125]

6          Despite these negative impacts it is important to recognize that the total

7   impact on the housing and tourist industry is expected to be positive because of

8   the expected increase in these industries' total revenues associated with the influx

9   of people. These positive impacts are discussed in detail in the testimony of

10  Staff's witness Dr. Madden.

11

12  **Q.    WHAT WILL BE THE NEGATIVE IMPACTS RELATED TO LAW**

13  **ENFORCEMENT?**

14  A.    These effects may be associated with the general increase in population and

15  economic activity. For example, the Application discusses the need for additional

16  traffic patrol activities because of the increased amount of traffic due to

17  construction.[126] Similarly, the Local Review Committee explains that "just the

18  increase in the number of workers will likely impact the crime and civil case load.

19  Taken together, the Sheriff's workload will increase."[127] The Local Review

---

[126] Application, p. 126.
[127] Report of the Local Review Committee, p. 16.

1    Committee recommends that an additional officer be added to the Grant County's

2    Sheriff's office. The Applicants stated that they agreed to provide funding for this

3    additional position.[128]

4         Based on the experience of Big Stone I's construction, drinking and

5    driving by the construction workers is perceived as a potential issue.[129] To

6    mitigate this problem, the Local Review Committee recommends that the

7    Applicants conduct drug screening of its employees,[130] as is currently being done

8    in construction of the Weston 4 power plant in Wisconsin. Note that the

9    Applicants stated that they plan to follow the recommendations of the Local

10   Review Committee and conduct drug and alcohol screening of employees,

11   including "pre-employment, random, post-accident and for-cause testing."[131]

12   Staff supports this recommendation. Staff would further recommend that the

13   Applicants submit a plan setting forth its actions to implement these

14   recommendations.

15

16   Q.   WERE ANY OTHER NOTICEABLE NEGATIVE IMPACTS ON THE

17        LOCAL COMMUNITY IDENTIFIED?

18   A.   No. The Applicants surveyed local governments and local infrastructure services

19        including schools, health facilities, fire departments, local water and sewer

20        systems, and cultural resources. The results of this survey suggest that local

---

7873

QSI
consulting, inc.

1    governments support the project, and that the local infrastructure should be able to

2    accommodate the increased load. The Applicants agreed, following the

3    recommendation of the Local Review Committee, to provide fire protection

4    equipment and training to the local fire department.[132] In addition, the Applicants

5    intend to comply with another recommendation of the Local Review Committee –

6    to appoint a public relations representative who would facilitate the exchange of

7    information between the project owners and local communities.[133] The

8    Applicants are making arrangements for solid waste management of construction

9    waste, as well as the construction workers' personal solid waste.[134]

10      Several minor adverse effects of the project on communities should be

11    mentioned. As discussed above, traffic is expected to increase during

12    construction, however, the Application discussed possible mitigation measures

13    including radar signs, traffic counters and arranged private transportation to and

14    from the site if traffic and parking become an issue.[135] The Draft Environmental

15    Impact Statement[136] suggested several measures to mitigate adverse transportation

16    impacts, including coordination with County authorities to mitigate severe road

17    damage (TR-1); organization of bus transportation or car pooling to reduce

18    congestion (TR-2); and delivery of heavy equipment in such a manner as to

---

7874

1    reduce traffic congestion and unsafe driving conditions. Staff supports these

2    recommendations.

3           The Application also mentions that railroad traffic will increase from three

4    to four deliveries per week to six to eight deliveries per week. Because of the

5    existence of an underpass and overpass in Milbank, the additional train traffic

6    should not have an effect on road traffic. Although the increased rail traffic will

7    increase the level of noise, the intensity of traffic is comparable to what it was in

8    the past – specifically, one train a day between 1975 and 1995.[137] Additional

9    noise may be created by night time construction activity, which the Applicants

10   plan to perform in cases where technology requires a continuous 24-hour activity.

11   However, the Applicants anticipate that there will be only 20 instances that will

12   require such night-time operations.[138]

13          The project may cause displacement of two to three households: the

14   Application identified two properties that may need to be vacated in order to

15   accommodate construction. These properties have either been purchased or are

16   under option to be purchased.[139] Another household is located in close proximity

17   to the future site, and the Applicants made an offer to purchase this property in

18   order to maintain a buffer zone.[140] In addition, the project will permanently take

---

1  out of production a certain amount of farm land, but this amount constitutes only

2  0.17% of prime farmland in Grant County.[141]

3

4  Q.  **WHAT ARE THE MAIN POSITIVE IMPACTS OF THE PROJECT ON**

5  **THE LOCAL COMMUNITY?**

6  A.  The project's positive impacts come from two sources – additional tax revenues

7  for local taxing authorities,[142] and the stimulation of the local economy through

8  project-related spending.[143]  These impacts, which are associated not only with

9  the construction, but also the operation stage of the project, have already been

10  briefly discussed in section III.D of this testimony where these positive impacts

11  were compared to the negative environmental impacts of the project.

12  **IV.  OTHER CONSIDERATIONS**

13  Q.  **ARE THERE OTHER AREAS THE COMMISSION SHOULD CONSIDER**

14  **AS IT MAKES ITS DECISION?**

15  A.  Yes.  Given the huge investment associated with this project, it is appropriate for

16  the Commission to consider the risks to both the consumers and utilities

17  themselves in making this financial commitment.  While the Applicants in this

18  proceeding who serve customers in South Dakota have not at this point filed for

19  recovery of this investment, that day will likely come.  Likewise, for the Co-

20  Owners that are regulated by the Commissions in other states, at some point in the

---

[141]  Responses to Staff's 2nd Set of Interrogatories, Request No. 18.
[142]  Application, Section 5.1.5 and Direct Testimony of Janelle Johnson.
[143]  Application, Section 5.1.1 and Direct Testimony of Randall M. Stuefen.

1   future, such utilities will go before their appropriate commission(s) seeking

2   recovery for the plant. Therefore, any risks that may impact the ability of the

3   utilities to recover the costs of Big Stone II, or that may impact the ability of

4   consumers to benefit from the existence of Big Stone II, should be addressed at

5   this point in time.

6

7   **Q. PLEASE DISCUSS HOW RATEPAYERS COULD BE IMPACTED IF**

8   **RISKS ARE NOT APPROPRIATELY CONSIDERED.**

9   A.   The Applicants to this case will undoubtedly seek to recover the costs associated

10   with this plant through the selling of its output. Because it is the Applicants'

11   ratepayers who will be the buyers in this transaction, it becomes clear that the

12   costs associated with building Big Stone II and the correlating price of the output

13   it produces may be borne by the ratepayers. These ratepayers do not play a direct

14   role in making the determination to build Big Stone II, yet, in the end, they may

15   be held responsible for those decisions.

16

17   **Q. WHY WOULD THE APPLICANTS EXPOSE SOUTH DAKOTA**

18   **RATEPAYERS AND OTHER RATEPAYERS TO EXCESSIVE RISK?**

19   A.   Because the Applicants have the ability to divert this financial responsibility (on a

20   "cost plus" basis) onto their ratepayers, the Applicants have less of an aversion to

21   taking financial risk and making financially risky management decisions than if

22   the responsibility was to be borne solely by the shareholders of the respective

7877

1  utilities. Because there is a strong likelihood that ratepayers will bear at least part

2  of the burden, they are exposed to risky management decisions.

3

4  **Q.  COULD POWER FROM BIG STONE II BE SOLD TO BUYERS OTHER**

5  **THAN RATEPAYERS ON THE WHOLESALE MARKET?**

6  A.  Yes. Wholesale buyers may buy power from the Applicants from Big Stone II.

7  However, if the decision to construct Big Stone II is not economically sound, and

8  because wholesale purchasers have greater choice than the Applicants' captive

9  ratepayers, it is unlikely that such a transaction could occur profitably. In other

10  words, if risks taken today result in the ultimate cost of Big Stone II being higher

11  than the existing market, it is unlikely that wholesale customers would be willing

12  to "bail out" the captive ratepayers.

13

14  **Q.  PLEASE DISCUSS HOW THE UTILITIES COULD BE IMPACTED IF**

15  **RISKS ARE NOT APPROPRIATELY CONSIDERED.**

16  A.  As I mentioned above, the utilities participating in the Big Stone II project can

17  only recover the costs associated with the plant through appropriate filings with

18  their respective state commissions. Should any of these Commissions determine

19  that the plant (or a portion of the plant) is not "used and useful," there is a risk

20  that the utilities would not have the ability to pass those costs through to their

21  ratepayers. Such a decision by one or more state commissions would leave the

22  Co-Owners of Big Stone II with an asset for which there is no way to recover the

23  costs.

1        It should be clear that because the issue of cost recovery for this project

2    will come before regulatory bodies other than the South Dakota Public Utilities

3    Commission, the potential decisions by these other bodies should be considered

4    part of the risks that the SD PUC should take into account.

5

6   **Q.**    **HOW COULD IT IMPACT SOUTH DAKOTA RATEPAYERS AND**

7       **UTILITIES IF OTHER STATE COMMISSIONS DISALLOWED BIG**

8       **STONE II?**

9   **A.**    If another commission didn't allow one or more of the utilities it regulates to

10    recover all or a portion of the costs associated with Big Stone II, it could

11    jeopardize that utility's ability to uphold its obligations relative to the project.

12    Such an outcome could result in the remaining Co-Owners having an increased

13    burden with respect to recovering the costs of Big Stone II.

14

15   **Q.**    **WHAT IS THE MAIN POINT WITH RESPECT TO THIS PORTION OF**

16       **YOUR TESTIMONY?**

17   **A.**    The main point is that regardless of whether it is shareholders or ratepayers

18    bearing the financial burdens associated with risky management decisions, poor

19    decision making at this point in time may haunt this Commission in the future. I

20    only mention this to emphasize the fact that in making this decision, the

21    Commission is setting the stage upon which future decisions – which will have

22    direct financial impacts on both ratepayers and the utilities it regulates – will be

23    made.

7879

1

2   **Q.   ARE THERE PARTICULAR ISSUES THAT YOU HAVE IDENTIFIED**

3   **WHICH MAY EXPOSE THE CO-OWNERS AND THEIR RATEPAYERS**

4   **TO RISKS?**

5   A.   Yes, there are a number of issues which should be thoroughly considered by the

6   Commission as part of its decision making process in this proceeding.  Among

7   those are:

8   • The potential that Big Stone II will not have a reliable fuel source.

9   • The potential that Big Stone II will be subject to taxes and

10   emission restrictions that will dramatically increase the cost of

11   production.

12   Of course, the other side of the risk considerations is the possibility of

13   electricity shortages or higher electricity prices in the event Big Stone II is not

14   constructed.

15

16   **Q.   HOW REAL IS YOUR CONCERN THAT BIG STONE II MAY NOT**

17   **HAVE AN ADEQUATE AND RELIABLE FUEL SOURCE?**

18   A.   I believe that is a very real concern.  The Co-Owners of Big Stone I recently

19   curtailed production due to the fact that they were running short of coal.

20   According to a recently published report, the Plant Manager of Big Stone I, Jeff

21   Endrizzi was quoted – regarding Big Stone I's inability to adequately stockpile

22   coal – as saying "Nothing like this where it's an extended period and we see no

7880

1    end in sight as it sits today."[144] Keith Kelley, the Big Stone Fuel supervisor also

2    expressed concern regarding the ability to hold its customers costs down, given

3    this situation.

4

5  **Q.**   **DO YOU AGREE WITH MR. ENDRIZZI THAT THERE IS "NO END IN**

6    **SIGHT" WITH RESPECT TO THIS ISSUE?**

7  **A.**   From what I understand, the crux of this issue is not that there is not enough coal,

8    or even that not enough coal is being mined. The key factor in the inability of Big

9    Stone I and other coal-fired generation facilities to maintain an adequate supply of

10   fuel is that the railroads delivering the coal are capacity restricted. In other words,

11   as demand for coal (particularly from the Powder River Basin) increases, the

12   existing rail infrastructure is becoming inadequate. As I already mentioned,

13   BNSF railroad named an unprecedented demand for coal as one of the main

14   factors that created the current coal shortage at Big Stone I. I also mentioned that

15   over twenty coal fired plants requiring rail service in the Western United States

16   have been proposed to start operation between 2006 and 2012, thus increasing the

17   demand for railroad coal transportation. As such, the ability of the railroads to

18   deliver this necessary fuel at prices consistent with the past, is becoming difficult,

19   if at all possible to maintain. Therefore, I believe that this issue may present risks

20   to the Co-Owners that are not addressed in their application. Further, this issue

21   represents a risk to ratepayers, who will likely be expected to pay for Big Stone II.

22   As the Chairwoman of the Arkansas Public Service Commission, Sandra

[144]   http://keloland.com/News/NewsDetail15440.cfm?Id=0.46855.

7881

1   Hochstetter was recently quoted "We're going to have a really huge problem if

2   railroads aren't held accountable for reliable deliveries and reasonable prices."[145]

3   This problem is so serious that the U.S. Senate Committee on Energy and Natural

4   Resources scheduled a special hearing on this issue on May 25, 2006.[146]

5

6   **Q.   HOW DO EMMISSION AND TAX ISSUES INCREASE RISK TO**

7   **RATEPAYERS AND THE UTILITIES?**

8   A   A great deal of uncertainty surrounds emission standards and potential taxes on

9   the emissions associated with coal-fired generation.  The SD PUC will likely not

10  make decisions on either of these issues, but, will be forced to deal with the

11  problems associated with them, should taxes be higher than anticipated, or

12  restrictions tightened.  Either of these two events would negatively impact South

13  Dakota ratepayers, the Co-Owners of Big Stone II or both.

14

15  **V.   CONCLUSIONS**

16  **Q.   WHAT ARE YOUR RECOMMENDATIONS REGARDING THE**

17  **APPLICATION?**

18  A.   Although the upcoming rounds of testimonies by other parties, including the

19  Applicants, may cause Staff to alter its recommendations, Staff's preliminary

20  recommendation is that the application should be approved subject to the

---

[145]   Post-gazette.com.  "Railroads struggle to deliver coal to utilities," Wednesday, March 15, 2006.

[146]   http://energy.senate.gov/public/index.cfm?Fuseaction=Hearings.Hearing&Hearing_ID=1560.

1    condition that all applicable permits are issued. Staff bases this recommendation

2    on its analysis showing that the project generally satisfies the criteria contained in

3    SDCL 49-41B and ARSD 20:10:22. The main negative impact of the project

4    concerns the environment, but the plant is expected to operate within the

5    applicable environmental regulations. Staff's quantitative analysis showed that

6    when the environmental impacts are estimated in monetary terms, the net benefits

7    of the project (the economic impact minus the environmental impact) are likely to

8    be positive.

9         Staff's specific recommendations regarding the community impact is that

10   the Applicants submit a plan setting forth its actions to implement

11   recommendations of the Local Review Committee, which Staff supports. These

12   recommendations include a housing contingency plan to be developed by the

13   Applicants; financing of an additional officer to the Grant County's Sheriff's

14   office; drug and alcohol screening of the Big Stone II employees; provision of fire

15   protection equipment and training for the local fire department; and an

16   appointment of a public relations representative that would facilitate the exchange

17   of information between the project owners and local communities.

18        In addition, Staff supports recommendations contained in the Draft

19   Environmental Impact Statement[147] that concern plant construction and operation,

20   including the following:

---

[147]   WEPA "Draft Environmental Impact Statement: Big Stone II Power Plant and Transmission
        Project," May 2006, Section 4.

7883

1    • Vegetation: implementation of an integrated weed control plan prior to

2    construction (V-1).

3    • Transportation: coordination with County authorities to mitigate severe

4    road damage (TR-1); organization of bus transportation or car pooling to

5    reduce congestion (TR-2); and delivery of heavy equipment in such a

6    manner as to reduce traffic congestion and unsafe driving conditions.

7    • Public safety: establishment of a work safety program (PH-1); secure

8    after-hours access to construction areas (PH-2); and notification of public

9    about high-risk operations (PH-3).

10   • Noise: work with local residents to develop noise mitigation measures in

11   case of noise complaints (N-1).

12   Further, Staff recommends that the Applicants supplement the record with all the

13   missing information identified in Table 2 of this testimony.

14   Absent the complete implementation of these conditions, Staff would

15   recommend that the Application be denied.

16

17   **Q.    DOES THIS CONCLUDE YOUR TESTIMONY?**

18   A    Yes.

THIS TAB CONTAINS ASSUMPTIONS USED IN PRESENT VALUE CALCULATIONS

| | |
|---|---|
| Life of the Plant | 40 |
| Discount Rate | 10% |

THIS TAB COMPARES THE ENVIRONMENTAL IMPACT ESTIMATES FOR THE TESTIMONY WITH THE ECONOMIC IMPACTS

*To generate this table, change Discount rate to 3% in Tab Assumptions*

**Table 7A. Comparison of Negative Environmental and Positive Local Impacts of Big Stone II.**
 **CO2 Externalities Based on Literature Values. 3% Discount Rate.**
 **Present Value over 40-year Life of the Plant (2005 dollars).**

| Measure | Lower Boundary | Upper Boundary | Average |
|---|---|---|---|
| **I. Negative Impact: Externalities from Pollution (No geographic boundaries defined)** | | | |
| Total Externalities Including CO2 | $ 82,561,866 | $ 1,981,269,062 | $ 1,031,915,464 |
| Total Externalities Excluding CO2 | $ 32,462,990 | $ 277,907,289 | $ 155,185,139 |
| **II. Positive Impact: Local Economic and Tax Effects (State of South Dakota)** | | | |
| Total Impact | $623,107,670 | $671,834,785 | $ 647,471,227 |
| **III. Net Impact** | | | |
| Net Impact Including CO2 | $ (1,358,161,392) | $ 589,272,919 | $ (384,444,236) |
| Net Impact Excluding CO2 | $ 345,200,381 | $ 639,371,795 | $ 492,286,088 |

\* – Lower Boundary of Net Impact = Lower Boundary of Positive Impact - Upper Boundary of Negative Impact.
Similarly, Upper Boundary of Net Impact = Upper Boundary of Positive Impact - Lower Boundary of Negative Impact
