1 Witness Information

2 **Q. Please state your name and business address.**

3 **A.** My name is Todd A. Guldseth. My business address is 40 East Broadway,  
4 Butte Montana, 59701.

5  
6 **Q. By whom are you employed and in what capacity?**

7 **A.** I am employed by NorthWestern Energy ("NWE" or "NorthWestern") as a  
8 Planner in Energy Supply.

9  
10 **Q. Please summarize your education and employment experience.**

11 **A.** I graduated from Montana Tech in 1990 with a B.S. Degree in Business  
12 Administration, and from the University of Montana in 1992 with a Masters in  
13 Business Administration. In September 2005, I earned the right to use the  
14 Chartered Financial Analyst designation.

15  
16 I joined NorthWestern Energy in July 2003 as a Financial Analyst in the  
17 Financial Planning and Analysis Group. In November 2008, I moved to the  
18 Energy Supply Group as a Planner, where my duties include assisting in the  
19 development of the biennial resource procurement plan, analyzing potential  
20 energy resources for addition to the supply portfolio, and modeling the  
21 impact of variables such as variations in load, resource stack, and other  
22 items that could affect the supply portfolio.

**Purpose of Testimony**

**Q.** What is the primary purpose of your testimony?

**A.** My testimony addresses:

- 1. The impact of the Spion Kop Wind Generation Project ("Spion Kop") on the cost of NorthWestern's supply portfolio;
- 2. Spion Kop's cost and value in comparison to alternative energy resources; and
- 3. The consistency of the 2009 Request For Information ("RFI), and consequently the Spion Kop acquisition, with the conclusions and action plans outlined in NWE's 2007 and 2009 Resource Procurement Plans ("RPP"), and § 69-8-419, MCA.

**Impact of Spion Kop on Supply Portfolio Cost**

**Q.** Please explain the impact of the acquisition of Spion Kop on the cost of NorthWestern's supply portfolio.

**A.** Because the Spion Kop cost of service has no variable components that will be tracked, the Spion Kop fixed cost of service, or revenue requirement, will be added into the generation asset mix already established under the Electricity Supply Service umbrella. Colstrip Unit 4 and the Dave Gates Generating Station at Mill Creek ("DGGS") are also included among these generation assets. The following table illustrates the total electric supply rate with and without the impact of Spion Kop's fixed cost of service:

Illustrative Average Supply Rate Comparison With & Without Spion Kop Based on May 2011 - April 2012 Electric Tracker Filing			
Electric Supply Rates: (\$/MWh)	May 2011 Forecast	2013 Spion Kop	2014 Spion Kop
Market Purchases & Other Supply Costs	\$37.59	\$36.89	\$36.89
Colstrip Unit 4 Fixed	\$12.67	\$12.67	\$12.67
Colstrip Unit 4 Variable	\$3.61	\$3.61	\$3.61
Dave Gates Generation Station Fixed	\$4.58	\$4.58	\$4.58
Dave Gates Generation Station Variable	\$1.83	\$1.86	\$1.86
Spion Kop Fixed Cost of Service	n/a	\$1.18	\$1.61
<b>Energy Supply Total:</b>	<b>\$60.23</b>	<b>\$60.78</b>	<b>\$61.21</b>
<i>\$ Difference from May 2011 Forecast:</i>		<i>\$0.50</i>	<i>\$0.93</i>
<i>% Difference from May 2011 Forecast:</i>		<i>0.8%</i>	<i>1.5%</i>

17

Comparing the May 2011 tracker costs without Spion Kop to the May 2011 tracker costs including Spion Kop, market purchase costs decrease by an estimated \$0.70/MWh as a result of Spion Kop's energy production. Colstrip Unit 4 fixed and variable costs, and DGGs fixed costs are not impacted by the addition of Spion Kop. Variable costs at the DGGs increase \$0.03/MWh due to the increased production necessary to serve the incremental 7 to 8 MW of regulation required to support integration of Spion Kop on the transmission system as described in the Prefiled Direct Testimony of Mike Cashell. The new DGGs variable cost rate of \$1.86/MWh reflects increased fuel expense partially offset by increased energy revenue credits, as discussed below. Finally, Spion Kop's fixed cost of service is layered in. The total Spion Kop fixed cost revenue requirement as well as an explanation of the difference in Spion Kop's revenue requirement between 2013 and 2014 due to bonus depreciation is discussed in the Prefiled Direct Testimony of Pat DiFronzo. Note that unlike Colstrip Unit 4 and the DGGs, Spion Kop does not include a variable cost component. This is because its

1 fuel, wind, does not incur a cost and all operating and maintenance  
2 expenses are included in the fixed cost of service.

3

4 **Q. Please explain how Spion Kop impacts the supply portfolio's cost of**  
5 **regulation.**

6 **A.** As explained above, 7 to 8 MW of incremental regulation will be required by  
7 Spion Kop and will be provided by the DGGs. As a result of the increased  
8 regulation need, production at DGGs will increase by an estimated 2  
9 Average Megawatts ("MWa") requiring an additional 137,983 Dkt of natural  
10 gas. Assuming an average price of \$4.6034/Dkt for natural gas, the  
11 increased annual fuel expense equals \$635,194. Energy revenue credits will  
12 also increase as a result of the increased production at the plant. Assuming  
13 the 2 MWa can be valued at \$25.93/MWh (Mid-C price of \$32.93/MWh  
14 minus a Mid-C to Montana market discount of \$7.00/MWh) for each hour of  
15 the year (8,760), the increased energy revenue credit equals \$454,207. The  
16 increase in fuel expense offset by the increase in energy revenue credit  
17 results in a net annual DGGs variable cost increase of \$180,987. Dividing  
18 this net annual increase by the forecasted sales volumes for May 2011 –  
19 April 2012 (5,916,672 MWh) results in the \$0.03/MWh DGGs Variable Cost  
20 rate increase reflected in the table above.

21

1 Comparison to Alternative Resources

2 **Q.** As a general matter, how does NorthWestern compare the relative  
3 costs and benefits of alternative energy resources?

4 **A.** Many things need to be considered when evaluating resources. These  
5 resource parameters include:

- 6 • How well the resource meets the energy and capacity needs of the  
7 utility;
- 8 • The risks associated with managing the resource, such as fuel supply  
9 risk or transmission availability;
- 10 • The costs of the resource, including integration costs, transmission  
11 costs and other indirect costs of the project;
- 12 • The environmental attributes of the resource, including whether the  
13 resource meets the eligibility criteria for renewable resources in the  
14 state of Montana; and
- 15 • Whether the resource contributes to fuel and resource type diversity in  
16 the supply portfolio.

17  
18 NorthWestern employs a variety of processes to ensure proper consideration  
19 of each of these factors for all possible resources. These include needs  
20 assessments for the portfolio, consultation with the Electric Technical  
21 Advisory Committee ("ETAC"), the development and use of the biennial  
22 RPPs, and the use of broad market solicitations such as the 2009 RFI in  
23 resource procurement processes.

1

2 **Q. Do the costs of Spion Kop compare favorably to other alternatives?**

3 **A.** Yes. The levelized cost of Spion Kop in comparison to the levelized cost of  
4 alternative energy resources is summarized in the following table. The  
5 alternative resources chosen for comparison include: (1&2) entering into  
6 market contracts and buying market renewable energy credits ("RECs") to  
7 meet the Renewable Portfolio Standard ("RPS"), (3&4) entering into market  
8 contracts but not buying market RECs and not meeting RPS, (5) entering  
9 into Qualifying Facility ("QF") contracts, (6) the generic wind pricing  
10 incorporated in the 2009 RPP, and (7) the next lowest priced power  
11 purchase agreement ("PPA") of the proposals that made the final four in the  
12 2009 RFI.

13

Total Cost of Alternative Energy Resources (All 25-year levelized \$/MWh except Hypothetical Wind and 2009 RFI PPA are 20-year)					
Resource Type	Energy	RECs	Sub-Total Energy + RECs	Integration	Total Comparative Cost
1. Market + RECs	\$83.89	\$7.48	\$91.37	\$0.00	\$91.37
2. Sensitivity Market Scenario + RECs	\$68.04	\$7.48	\$75.52	\$0.00	\$75.52
3. Market Only	\$83.89	\$0.00	\$83.89	\$0.00	\$83.89
4. Sensitivity Market Scenario Only	\$68.04	\$0.00	\$68.04	\$0.00	\$68.04
5. QF-1 Option 3: Wind Only Rate	\$61.73	\$7.48	\$69.21	\$14.99	\$84.20
6. Hypothetical Wind in 2009 RPP	\$59.34	\$7.48	\$66.82	\$14.99	\$81.82
7. 2009 RFI Second Lowest PPA	\$57.40	\$7.48	\$64.88	\$14.99	\$79.87
8. Spion Kop Wind Project	\$46.29	\$7.48	\$53.78	\$14.99	\$68.77

1. 25-year flat energy rate based on 2009 RPP Base Case Delay Carbon market price forecast - carbon penalty begins 2017. This is a buy market energy and market RECs scenario to satisfy RPS.

2. 25-year flat energy sensitivity scenario based on 2009 RPP Base Case Delay Carbon market price forecast revised with November 2010 forward electric and gas prices. This is a buy market energy and market RECs scenario to satisfy RPS.

3. 25-year flat energy rate based on 2009 RPP Base Case Delay Carbon market price forecast - carbon penalty begins 2017. RECs are not purchased and RPS is not achieved.

4. 25-year flat energy sensitivity scenario based on 2009 RPP Base Case Delay Carbon market price forecast revised with November 2010 forward electric and gas prices. RECs are not purchased and RPS is not achieved.

5. Current QF-1 Tariff Option 3 rate of \$69.21, set by the PSC and based on the 2007 RPP, includes energy and RECs. This rate is currently the subject of an open PSC proceeding.

6. Pricing for Hypothetical Wind included in 2009 RPP was based on PPA pricing information obtained in the 2009 RFI.

7. Levelized PPA price of second lowest proposal submitted in 2009 RFI. \$64.88 includes energy and RECs.

8. Spion Kop levelized rate of \$53.78 includes energy and RECs.

3  
4  
5  
6  
7  
8  
9  
10  
11  
12

Total comparative cost variables include energy, RECs, and integration. The energy cost component consists of the cost of energy plus a carbon penalty adder in the market purchase comparisons (1-4), and the cost of energy only in the renewable comparisons (5-7). NorthWestern believes that carbon legislation in some form will exist in the future and has included a carbon penalty in the market forecasts beginning in 2017 and escalating over the 25-year forecast period. The REC price is equal to the 20-year levelized price of RECs utilized in the 2009 RPP. Although NorthWestern does not possess significant REC market experience on which to base the 2009 RPP REC forecast, using it does provide consistency with how NorthWestern has

1 conducted its resource planning and resource comparisons in recent years,  
2 and the forecast is in a reasonable range relative to the \$10/MWh penalty  
3 NorthWestern would incur for failing to meet RPS requirements. The wind  
4 integration rate of \$14.99/MWh is equal to the 20-year levelized integration  
5 rate based on DGGS costs and utilized in the 2009 RPP. Wind integration  
6 costs are not included in any of the renewable resource PPA or acquisition  
7 rates, including Spion Kop, but they have been added so that the total costs  
8 of renewable energy are reflected in the table.

9  
10 Comparisons 1 and 2 are market based alternatives that assume RECs will  
11 also be purchased on the open market in order to satisfy RPS requirements.  
12 Comparison 1 is based on the 2009 RPP Base Case market price forecast  
13 and includes the carbon penalty described above, and Comparison 2 is a  
14 sensitivity scenario performed on the 2009 RPP Base Case market price  
15 forecast using November 2010 forward electric and natural gas prices.  
16 These two comparisons are somewhat imperfect because they are not valid  
17 alternatives due to the unlikelihood of being able to sign a 25-year market  
18 contract and the current illiquid REC market; however, they do give an idea  
19 of how Spion Kop compares to the market over the long-term.

20  
21 Comparisons 3 and 4 are equal to Comparisons 1 and 2 respectively, but  
22 without REC purchases. As a result, RPS requirements are not met in these  
23 two comparisons. As with Comparisons 1 and 2, these two comparisons are

1 somewhat imperfect due to the unlikelihood of being able to sign a 25-year  
2 market contract; however, they provide a range that helps complete the  
3 required analysis pursuant to §69-3-2007, MCA, the cost cap statute, which  
4 is discussed further below.

5  
6 Comparison 5 is the current QF-1 Option 3, wind-only rate of \$69.21/MWh.  
7 This rate was set by the Montana Public Service Commission  
8 ("Commission") based on the 2007 RPP and includes energy and RECs.  
9 Integration costs have been added to reflect the total cost of the resource.

10  
11 Comparison 6 is the generic wind pricing used in the 2009 RPP and is based  
12 on PPA information obtained in the 2009 RFI. Again, the PPA pricing  
13 included energy and RECs but not integration costs, so they have been  
14 added to reflect the total cost of the resource.

15  
16 Comparison 7 reflects the second lowest PPA offer of the four finalists in the  
17 2009 RFI. The PPA rate of \$64.88/MWh includes energy and RECs, and  
18 integration costs have been added to reflect the total cost of the resource.

19  
20 Spion Kop's levelized price is \$53.78/MWh and includes energy and RECs,  
21 and integration costs have been added to reflect the total cost of the  
22 resource. The levelized price is based on the stream of annual unit prices  
23 computed for the 25-year estimated life of the project. The unit prices are

1           *computed by dividing the projected revenue requirement for each year by the*  
2           *estimated annual production of 138,000 MWh described in the Prefiled Direct*  
3           *Testimony of Steve Jones. The 25-year revenue requirement worksheet*  
4           *deriving the levelized price is attached in Exhibit\_(TAG-01).*

5  
6           To summarize the alternative resource comparison table, Spion Kop has a  
7           lower total cost than six of the seven alternatives and is very close to the  
8           lowest cost resource. Comparison 4, which is the 25-year Sensitivity Market  
9           Scenario without RECs resource, is the lowest cost alternative by  
10          \$0.73/MWh but does not achieve compliance with the RPS and is not readily  
11          available for a term of 25 years in the current electric market environment.  
12          But, as discussed above, Comparisons 3 and 4 provide a cost range that  
13          helps satisfy the requirements in §69-3-2007, MCA, which provides that a  
14          utility is "not obligated" to take electricity from an eligible renewable resource  
15          unless the eligible renewable resource has "demonstrated through a  
16          competitive bidding process that the total cost of electricity from that eligible  
17          resource, including the associated cost of ancillary services ... is less than or  
18          equal to bids for the equivalent quantity of power over the equivalent contract  
19          term from other electricity suppliers." NorthWestern believes that these  
20          requirements have been satisfied via comparisons of total costs, including  
21          ancillary costs, to several alternative resource options including two that are  
22          energy-only and do not achieve RPS compliance.

23

1     **Q. Does Spion Kop possess any non-price benefits or risk mitigation**  
2            **characteristics?**

3     **A.** Yes. In addition to Spion Kop being in-line with alternative resources from a  
4            cost stand-point, it also possesses characteristics that shield it from several  
5            potential risks over the long-term. The first risk is the volatility in the power  
6            markets to which a supply portfolio is exposed if it relies too heavily on  
7            market purchases to fulfill its load serving obligations. Even long-term  
8            market contracts, the longest of which normally do not exceed five years,  
9            expose a supply portfolio to the risk of renewing those contracts at unknown  
10           prices every few years. Although wind energy is variable by nature and  
11           exposes a portfolio to short-term market fluctuations to some degree, Spion  
12           Kop provides a long-term energy resource at a known price, thereby  
13           reducing the overall amount of the portfolio's exposure to volatile power  
14           markets.

15  
16           Second is the risk of green house gas ("GHG") emissions regulation, either  
17           by the Environmental Protection Agency ("EPA") or legislated by Congress.  
18           While it appears that congressional legislation is on the back-burner for the  
19           time being, the EPA is moving forward, albeit slowly, with regulations  
20           addressing GHG emissions via the Clean Air Act. If, or when, this happens,  
21           thermal generating plants will be impacted while resources that do not emit  
22           GHGs will provide price stability to supply portfolios that contain them. To  
23           give an idea of the degree of penalty a portfolio may experience by

1 substituting market purchases for wind energy, the levelized difference  
2 between the 2009 RPP Base Case Delay Carbon market forecast used in  
3 the alternative resource comparison table, which included a carbon penalty  
4 beginning in 2017 and was based on the proposed Waxman-Markey  
5 legislation, and the no-carbon market forecast used in the 2009 RPP is  
6 \$11.06/MWh. Multiplying this levelized penalty rate by Spion Kop's expected  
7 annual production of 138,000 MWh equals annual carbon risk mitigation of  
8 \$1.5 million.

9  
10 Third is volatility in fuel markets such as natural gas and coal. Because wind  
11 facilities do not consume any fuel, wind projects are immune to this volatility.

12  
13 Fourth is protection from having to achieve RPS compliance by transacting  
14 in an illiquid REC market. The current REC market has not developed into  
15 the type of liquid market in which buyers can be matched with sellers in a  
16 timely, efficient manner. And, even if an efficient REC market does develop,  
17 neighboring states and California have RPS requirements that substantially  
18 exceed Montana's and this could drive strong demand for RECs causing  
19 prices to escalate to very high levels. Combined with its current renewable  
20 resource portfolio, NorthWestern estimates that the addition of Spion Kop will  
21 allow for RPS compliance through 2015; absent Spion Kop, compliance will  
22 be in jeopardy as early as the 2013-2014 timeframe (see Exhibit\_TAG-(02)).

23

1           Lastly, an ownership benefit offered by Spion Kop is mitigation of the risk of  
2           an energy or RPS shortfall at the end of its projected life in 25 years. By  
3           owning Spion Kop rather than entering into a PPA (which will simply expire in  
4           25 years and expose the supply portfolio to the risks associated with  
5           replacing the contract, which could include market price risk, REC price and  
6           availability risk, and contract renewal risk), NorthWestern will have the option  
7           to continue running the project for the purpose of serving NorthWestern  
8           customers if its condition is adequate to do so, recapitalize the project if its  
9           condition is inadequate to serve customers, sell the project, or just sell the  
10          energy and RECs. Ownership of the project will allow NorthWestern to  
11          assess market conditions in 25 years and choose an option that best suits its  
12          customers.

13  
14       **Q. Has NorthWestern compared these non-price benefits and risk**  
15       **mitigation characteristics to other resource types?**

16       **A.** Yes. The following table illustrates some risk areas that various types of  
17       resources, both owned and contracted, hedge against. This is not  
18       necessarily an all-inclusive list of risks or resource types, but it gives an  
19       indication of the advantages different types of resources have relative to  
20       various types of risk. It is evident that selecting energy resources of only one  
21       or two types can leave a supply portfolio exposed to considerable risk, and  
22       that an owned wind resource provides diversity from more traditional thermal  
23       resources and market purchase contracts.

1

Risks Hedged by Various Energy Resource Types						
Resource Type	Potential Risk					
	Long-term Power Market Exposure	Short-term Power Market Exposure	Environmental Regulation	Fuel Price Volatility	Contract Renewal	Operating
Wind (owned)	X		X	X	X	X*
Wind (contract)	X		X	X		X
Thermal (owned)	X	X			X	
Thermal (contract)	X	X				X
Market (contract)		X		X		X

\*Spion Kop has an effective 10-year hedge by virtue of the Full Service Agreement with General Electric.

13

14

15

16

17

18

Long-term power market exposure arises when a supply portfolio relies too heavily on market purchase contracts rather than long-term assets, whether owned or contracted for. A portfolio is subjected to short-term power market exposure when its scheduled resources come up short of its load serving obligation. The variable nature of wind can expose a portfolio to short-term market volatility on both the buy and sell side, depending on how it has diverged from its schedule output. Environmental regulation includes GHG regulation as discussed previously, as well as SOx, NOx, and all other types of emitting regulations. Thermal plants are subject to volatility in the fuel markets such as coal and natural gas. Contract renewal risk is present when an existing contract expires and can include few or no counterparties to renew with, higher rates, or more stringent contract terms than the previous contract. Finally, operating risk concerns relate to all the costs associated with running and maintaining an owned asset. The addition of Spion Kop as an owned wind resource will provide a hedge from 1) long-term power

1 market volatility through its 25-year fixed-pricing, 2) environmental  
2 regulations because of its clean fuel and REC value, 3) volatile fuel prices, 4)  
3 contract renewal risks because of the value of ownership, and 5) operating  
4 risk, because the General Electric Full Service Agreement mitigates much of  
5 the operating risk over the first 10 years of operation.

6  
7 **Consistency of the Spion Kop Acquisition with the 2007 and 2009 RPPs, and**

8 **MCA**

9 **Q. Is the acquisition of Spion Kop Wind consistent with the overall**  
10 **approach toward wind generation contained in the 2007 and 2009**  
11 **RPPs?**

12 **A.** Yes. NorthWestern's 2007 and 2009 RPPs both included 150 MW of wind in  
13 their respective preferred portfolios. And, in the action items contained in  
14 each plan, NorthWestern stated its intention to conduct competitive resource  
15 solicitations with the objective of acquiring renewable resources in order to  
16 fulfill the portfolio need identified in the planning process. Following through  
17 on the stated action items in the 2007 RPP, NorthWestern initiated an RFI  
18 for renewable resources in the Fall of 2009.

19  
20 The 2009 RFI was in progress during the development of the 2009 RPP, but  
21 the 2009 RPP action items were consistent with the intent of the RFI. In  
22 Chapter 9 of the 2009 RPP, NorthWestern concludes that wind resources  
23 present a number of operational and economic challenges; yet, recognizing

1 the many benefits associated with wind, NorthWestern proposes a "cautious  
2 and incremental approach for new wind" and states that it will add  
3 approximately 50 to 75 MW of additional wind while it gains knowledge of  
4 how the additional wind will impact the supply portfolio. The acquisition of  
5 the 40 MW Spion Kop project is a strong step in fulfilling NorthWestern's  
6 intentions stated in Chapter 9.

7  
8 **Q. Is the acquisition of Spion Kop consistent with the three-year action  
9 plan in the 2009 RPP?**

10 **A.** Yes. In the three-year action plan items contained in Chapter 10 of the 2009  
11 RPP, NorthWestern states that, with regard to wind resources, it will: 1) look  
12 for opportunities to increase the geographic diversity of the wind portfolio  
13 (Action Item ("AI") 2.b.); 2) compare the value and costs of owned versus  
14 contracted wind resources when completing the 2009 RFI (AI 2.c.); 3) meet  
15 resource requirements through a combination of PPAs and equity  
16 acquisitions (AI 4.a.); 4) continue to meet RPS requirements by, among  
17 other methods, acquiring renewable projects through competitive  
18 solicitations (AI 5.b.); and 5) monitor carbon legislation and consider the risks  
19 associated with committing to resource acquisitions with and without carbon  
20 emissions (AI 9). The acquisition process of Spion Kop has been consistent  
21 with all of these action items.

22

1 Q. How does the addition of Spion Kop affect the GenTrader® modeling  
2 results and consequently the preferred portfolios selected in the 2009  
3 RPP?

4 A. To assess the effect of Spion Kop on the 2009 RPP, stochastic modeling  
5 under 2009 RPP Base Case Scenario assumptions was conducted on the  
6 preferred portfolios with two cases added: 1) a no-wind case was added to  
7 examine the benefit achieved in a portfolio by adding wind (every portfolio  
8 except one, #54, in the 2009 RPP contained additional wind under the  
9 assumption that wind would be the primary renewable resource utilized to  
10 meet RPS requirements); and 2) a case in which the 40 MW Spion Kop  
11 project replaced 40 MW of the generic wind modeled in the 2009 RPP  
12 planning process. The addition of these two cases, along with the original  
13 base case stochastic modeling from the 2009 RPP, form a trio of cases by  
14 which the relative effects of adding generic wind to a no wind portfolio and  
15 then further replacing a portion of that generic wind with Spion Kop wind can  
16 be analyzed and evaluated.

17  
18 Stochastic analysis was used rather than intrinsic analysis to determine  
19 the extent to which fixed price variable resources, such as wind, can add  
20 stability to a portfolio under volatile electric market conditions. The basic  
21 difference between stochastic and intrinsic modeling is that stochastic  
22 modeling incorporates volatility into model inputs, such as the electric  
23 price forecast and the fuel cost forecast. Because NorthWestern relies on

1 the electric market to fulfill a significant portion of its load-serving  
 2 obligation, the planning practice has been to add a volatility component to  
 3 the electric market price forecast so that long-term portfolio risk can be  
 4 evaluated along with long-term portfolio cost.

5  
 6 The following table reflects 20-year total costs for each of the three preferred  
 7 portfolios under the three cases previously described using the 2009 RPP  
 8 Base Case Scenario assumptions.

20-Year Total Portfolio Costs 2009 RPP Base Case Scenario			
Case	(A)	(B)	(C)
Preferred Portfolios	No Wind (does not meet RPS)	150MW Generic Wind (2009 RPP)	110MW Generic + 40MW Spion Kop
PF 21 300MW SCCT Frame	\$11,580,060,000	\$11,588,520,000	\$11,539,330,000
PF 24 300MW SCCT Aero	\$11,680,070,000	\$11,688,570,000	\$11,639,380,000
PF 27 200MW CCCT	\$11,866,160,000	\$11,874,630,000	\$11,825,440,000
(D) Preferred Portfolio Avg	\$11,708,763,333	\$11,717,240,000	\$11,668,050,000
<b>Total Cost Differences between Preferred Portfolio Averages (D): Higher/(Lower)</b>			
150 MW Hyp (2009 RPP) difference from No Wind: (B - A)			\$8,476,667
Spion Kop difference from No Wind: (C - A)			(\$40,713,333)
Spion Kop difference from 150 MW Hyp (2009 RPP): (C - B)			(\$49,190,000)

10  
 11  
 12  
 13 The analysis shows that the average 150 MW Generic Wind case (2009  
 14 RPP) costs \$8.5 million more than the average No Wind case over 20 years.  
 15 The Spion Kop case costs \$40.7 million less than the No Wind case and  
 16 \$49.2 million less than the 150 MW Generic Wind case. This result is due to

1 40 MW of higher-priced generic wind being replaced by 40 MW of lower-  
 2 priced Spion Kop wind.

3  
 4 The next table shows the 20-year total upside portfolio cost risk under the  
 5 same electric market volatility conditions used in the 2009 RPP. The table  
 6 shows the increased cost above the 20-year total portfolio costs each of the  
 7 three portfolios could reasonably expect to experience under volatile market  
 8 conditions.

9

20-Year Total Upside Portfolio Cost Risk 2009 RPP Base Case Scenario			
Case	(A)	(B)	(C)
Preferred Portfolios	No Wind (does not meet RPS)	150MW Generic Wind (2009 RPP)	110MW Generic + 40MW Spion Kop
PF 21 300MW SCCT Frame	\$1,384,031,700	\$1,184,812,900	\$1,189,089,000
PF 24 300MW SCCT Aero	\$1,252,658,700	\$1,048,104,800	\$1,052,488,800
PF 27 200MW CCCT	\$1,182,302,200	\$983,744,800	\$987,915,600
<b>(D) Preferred Portfolio Avg</b>	<b>\$1,272,997,533</b>	<b>\$1,072,220,833</b>	<b>\$1,076,497,800</b>
<b>Total Upside Risk Differences between Preferred Portfolio Averages (D): Higher/(Lower)</b>			
150 MW Hyp (2009 RPP) difference from No Wind: (B - A)			(\$200,776,700)
Spion Kop difference from No Wind: (C - A)			(\$196,499,733)
Spion Kop difference from 150 MW Hyp (2009 RPP): (C - B)			\$4,276,967

10  
 11  
 12  
 13 Both the average 150 MW Generic Wind and Spion Kop cases reflect  
 14 approximately \$200 million in lower average upside portfolio cost risk than  
 15 the No Wind case. The \$4.3 million difference between the 150 MW Generic  
 16 Wind case and the Spion Kop case is due to differences in the timing of the  
 17 wind resources being placed into the portfolios. The conclusion that can be

1 drawn is that, under the 2009 RPP Base Case Scenario modeling  
2 assumptions, adding moderate amounts of wind to a portfolio that doesn't  
3 contain wind reduces exposure to volatile electric markets and, therefore,  
4 reduces the risk of higher portfolio costs at little or no increase to the long-  
5 term cost of the portfolio.

6  
7 These stochastic modeling results are further analyzed in comparative tables  
8 and displayed graphically in Exhibit\_(TAG-03). Box 1 on page 1 shows how  
9 the preferred portfolios' 20-year levelized rates respond when the 150 MW of  
10 2009 RPP generic wind was added to the No Wind case: the average 20-  
11 year levelized rate increased 0.3% but upside cost risk declined an average  
12 of 14.3%. Box 1 also shows that the No Wind case is subject to 10.1%  
13 upside cost risk while the 150 MW Generic Wind case is subject to 8.6%  
14 upside cost risk. By taking the percentage difference between the two  
15 upside cost risk values, the estimated decrease in upside cost risk by adding  
16 150 MW of generic wind to a portfolio without wind is 14.3%.

17  
18 Upside cost risk is measured as the difference between the 95% confidence  
19 level levelized rate, which represents the rate at which 95% of the modeled  
20 outcomes are either equal to or fall below, and the mean levelized rate  
21 (Upside Cost Risk = 95% Confidence Level – Mean Portfolio Cost). By using  
22 the 95% confidence level rate, extreme outliers are excluded from the  
23 analysis which reduces the likelihood of producing results that aren't

1 meaningful. The upside cost risk is then taken as a percentage of the mean  
2 levelized rate to determine the relative relationship between the two so it can  
3 be compared with the other cases.

4  
5 Box 2 on page 1 of Exhibit\_(TAG-03) shows how the preferred portfolios' 20-  
6 year levelized rates respond when 40 MW of generic wind is replaced by 40  
7 MW of Spion Kop wind – the average 20-year levelized rate actually declines  
8 0.1% compared to the No Wind case, and the average upside cost risk is  
9 reduced by 13.6%.

10  
11 The graph on page 2 of Exhibit\_(TAG-03) reflects these results visually. The  
12 2009 RPP preferred portfolios are represented by squares and define the  
13 efficiency frontier. Triangles represent the preferred portfolios in the No  
14 Wind case, demonstrating that when wind is taken out of the portfolio, a  
15 small decrease in cost is achieved at the expense of significantly higher  
16 upside cost risk. Circles represent the preferred portfolios in the Spion Kop  
17 case, reflecting a decrease in portfolio cost while maintaining the same level  
18 of upside cost risk as compared to the 2009 RPP preferred portfolios.

19  
20 **Q. Have you developed sensitivities on any 2009 RPP Base Case**  
21 **assumptions since the plan was submitted in June 2010?**

22 **A. Yes.** A Sensitivity Market Scenario was developed subsequent to the filing  
23 of the 2009 RPP that was based on November 2010 electric and natural gas

1 forward prices. The goal of this exercise was to determine the price and risk  
2 impact of lower market prices on the 2009 RPP preferred portfolios. The  
3 result was a significant decrease from the 2009 RPP Base Case electric  
4 price forecast and, consequently, a decrease in the total costs of the  
5 preferred portfolios.

6  
7 **Q. Does the Sensitivity Market Scenario have an impact on the price and**  
8 **risk associated with the preferred portfolios selected in the 2009 RPP,**  
9 **both with and without Spion Kop?**

10 **A.** Yes. Stochastic models with the 2009 RPP Base Case Scenario market  
11 price forecast replaced by the Sensitivity Market Scenario market price  
12 forecast were run on the preferred portfolios under the three cases  
13 previously described, No Wind, 150 MW Generic Wind (2009 RPP), and 110  
14 MW Generic Wind plus 40 MW Spion Kop Wind. The following table reflects  
15 20-year total portfolio costs for each of the three preferred portfolios under  
16 these assumptions.

17

20-Year Total Portfolio Costs Sensitivity Market Scenario			
Case	(A)	(B)	(C)
Preferred Portfolios	No Wind (does not meet RPS)	150MW Generic Wind (2009 RPP)	110MW Generic+ 40MW Spion Kop
PF 21 300MW SCCT Frame	\$10,606,940,000	\$10,751,030,000	\$10,697,750,000
PF 24 300MW SCCT Aero	\$10,750,050,000	\$10,894,180,000	\$10,840,900,000
PF 27 200MW CCCT	\$10,964,460,000	\$11,108,520,000	\$11,055,300,000
<b>(D) Preferred Portfolio Avg</b>	<b>\$10,773,816,667</b>	<b>\$10,917,910,000</b>	<b>\$10,864,653,333</b>
<b>Total Cost Differences between Preferred Portfolio Averages (D): Higher/(Lower)</b>			
150 MW Hyp (2009 RPP) difference from No Wind: (B - A)			\$144,093,333
Spion Kop difference from No Wind: (C - A)			\$90,836,667
Spion Kop difference from 150 MW Hyp (2009 RPP): (C - B)			(\$53,256,667)

1  
2  
3 Consistent with a lower market price forecast, total costs of each preferred  
4 portfolio decrease from the 2009 RPP Base Case Scenario costs by nearly  
5 \$1 billion over 20 years. However, the 150 MW Generic Wind case cost  
6 difference from the No Wind case increases from \$8.5 million to \$144.1  
7 million over 20 years, and the Spion Kop case's cost difference from the No  
8 Wind case goes from \$40.7 million less costly to \$90.8 million more costly  
9 over 20 years. The Spion Kop case is \$53.3 million less costly than the 150  
10 MW Generic Wind case.

11  
12 The next table shows 20-year total upside portfolio cost risk under the  
13 Sensitivity Market Scenario.

14

20-Year Total Upside Portfolio Cost Risk			
Sensitivity Market Scenario			
Case	(A)	(B)	(C)
Preferred Portfolios	No Wind (does not meet RPS)	150MW Generic Wind (2009 RPP)	110MW Generic + 40MW Spion Kop
PF 21 300MW SCCT Frame	\$1,034,210,700	\$877,562,900	\$881,530,800
PF 24 300MW SCCT Aero	\$949,731,700	\$792,086,600	\$796,287,800
PF 27 200MW CCCT	\$907,524,100	\$754,279,000	\$758,140,700
<b>(D) Preferred Portfolio Avg</b>	<b>\$963,822,167</b>	<b>\$807,976,167</b>	<b>\$811,986,433</b>
<b>Total Upside Risk Differences between Preferred Portfolio Averages (D): Higher/(Lower)</b>			
150 MW Hyp (2009 RPP) difference from No Wind: (B - A)			(\$155,846,000)
Spion Kop difference from No Wind: (C - A)			(\$151,835,733)
Spion Kop difference from 150 MW Hyp (2009 RPP): (C - B)			\$4,010,267

17

Both the 150 MW Generic Wind and Spion Kop cases reflect approximately \$150 million in lower average upside portfolio cost risk than the No Wind case. The \$4.0 million difference between the 150 MW Generic Wind case and the Spion Kop case is due to differences in the timing of the wind resources being placed into the portfolios. Comparing the two tables under the Sensitivity Market Scenario with the two tables under the 2009 RPP Base Case Scenario reveals that if electric market prices decline, the addition of fixed-priced wind increases the cost of a portfolio by a larger amount, and upside portfolio cost risk is mitigated by a smaller amount. However, both scenarios demonstrate that the addition of a moderate amount of fixed-priced wind benefits a portfolio in that there is a greater level of long-term price certainty, and that benefit is enhanced when the generic wind is replaced by Spion Kop wind.

1 These stochastic modeling results are further analyzed in comparative tables  
2 and displayed graphically in Exhibit\_(TAG-04). Boxes 1 and 2 on page 1  
3 show that the comparative results are very similar to the results in  
4 Exhibit\_(TAG-03) discussed earlier, except that the portfolio cost and upside  
5 risk levels are lower.

6  
7 The graph on page 2 of Exhibit\_(TAG-04) reflects these results visually.  
8 Compared to the graph in Exhibit\_(TAG-03), this graph is much more  
9 condensed and closer to the origin, indicating lower cost and lower risk  
10 portfolios. However, it can still be construed that by taking wind out of the  
11 2009 RPP Sensitivity Market Scenario preferred portfolios, represented by  
12 boxes, a decrease in cost is achieved at the expense of higher upside cost  
13 risk, as represented by the No Wind case triangles. Furthermore, by  
14 replacing 40 MW of generic wind with 40 MW Spion Kop wind, represented  
15 by circles, cost decreases with little or no difference in upside cost risk.

16  
17 **Q. Are there any provisions of ARM 38.5.8228 that require explanation with**  
18 **regard to NorthWestern meeting minimum filing requirements for**  
19 **approval of electricity supply resources?**

20 **A.** Yes. ARM 38.5.8228(2)(a) requires "a complete and thorough explanation  
21 and justification of all changes to the utility's most recent long-term resource  
22 plan and three year action plan, including how the utility has responded to all  
23 Commission written comments". To date, NorthWestern has not received

1 written comments on the 2009 RPP from the Commission which was filed in  
2 June 2010.

3  
4 Since the filing of the 2009 Plan, NorthWestern recognized, and has  
5 communicated to both the Commission and the ETAC a major change to the  
6 natural gas market that has had an immediate impact on the price of natural  
7 gas. This fundamental downward shift in North American natural gas prices  
8 is significant for resource planning purposes because it impacts both the  
9 electric market in the northwest and gas-fired resource costs. The change in  
10 the natural gas market is driven by fracking technology, horizontal drilling  
11 techniques, and the development of non-traditional shale resources.

12  
13 The preferred resources identified in the 2009 Plan continue to provide the  
14 best balance of cost and risk when considered in the portfolio context of the  
15 2009 Plan. The Sensitivity Market Scenario developed in November 2010  
16 does not change NorthWestern's conclusions about the addition of  
17 renewable wind resources to the portfolio or the value of Spion Kop.

18  
19 **Q. Is NorthWestern Energy's resource planning process consistent with**  
20 **the requirements of § 69-8-419, MCA?**

21 **A.** Yes. NorthWestern plans for future electricity supply resource needs  
22 consistent with § 69-8-419, MCA, managing a portfolio of resources to serve  
23 our customers' electricity needs and procuring new electricity supply

1 resources as needed. NorthWestern's RPP process meets the five  
2 objectives contained in § 69-8-419 (2), MCA. NorthWestern evaluates a  
3 wide range of resources and evaluates those resources not only in terms of  
4 price, but also on the basis of non-price factors like resource diversity,  
5 environmental attributes, and ability to mitigate market and fuel price risks.  
6 Preferred resource portfolios in both the 2007 RPP and 2009 RPP provide  
7 resource diversity while mitigating the potential impacts of environmental,  
8 fuel, and market price risk at lowest long-term total cost to ratepayers. As  
9 previously discussed, the acquisition of Spion Kop is consistent with the  
10 2009 RPP which identified wind as a priority resource.

11  
12 **Q. Is the acquisition of Spion Kop consistent with the requirements of**  
13 **ARM 38.5.8212 2(a)?**

14 **A.** Yes. In fulfilling the requirements of § 69-8-419, MCA, NorthWestern clearly  
15 defined its resource need in the 2007 RPP, AI #1. In AI #3 in the 2007 RPP,  
16 NorthWestern discussed issuing an RFP for renewable resources in 2008,  
17 which it did with insufficient results. This led to the design of the RFI that  
18 NorthWestern issued in August of 2009, resulting in the acquisition of Spion  
19 Kop. That RFI process is discussed in detail in the Prefiled Direct Testimony  
20 of Steve Lewis.

21  
22 Conclusion

23 **Q. Please summarize your conclusions.**

1     **A.** There are many requirements, risks, and costs that must be considered  
2         when adding a resource to the energy supply portfolio, and there is not a  
3         "one-size-fits-all" type of energy resource that can accommodate every  
4         concern. That is why it is important to not only consider the potential  
5         resource by itself but also in the context of the total supply portfolio. Spion  
6         Kop provides 25-year fixed-cost energy, RECs that will help achieve RPS  
7         requirements, shelter from potential GHG regulations, protection from volatile  
8         fuel markets, and ownership value beyond the initial 25-year period, all at a  
9         levelized cost that is lower than the current long-term QF-1 Option 3, Wind  
10        Only rate of \$69.21/MWh. Although there are economic and operational  
11        challenges associated with wind resources, when combined with all the other  
12        NWE energy supply resources, owning this project will enhance  
13        NorthWestern's entire energy supply portfolio.

14  
15     **Q.** Does this conclude your testimony?

16     **A.** Yes, it does.
