Rebuttal Testimony and Schedules

James R. Alders

Before the Public Utilities Commission of  
The State of South Dakota

In the Matter of the Application of  
Northern States Power Company, a Minnesota corporation

For Authority to Increase Rates for  
Electric Service in South Dakota

Docket No. EL11-019  
Exhibit\_\_\_\_(JRA-1)

Cost Recovery for the Nobles Wind Project

April 27, 2012

1                                   **I. INTRODUCTION AND QUALIFICATIONS**

2    Q.   PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

3    A.   My name is James R. Alders. My business address is 414 Nicollet Mall,  
4       Minneapolis, Minnesota 55401.

5

6    Q.   BY WHOM ARE YOU EMPLOYED AND WHAT IS YOUR POSITION?

7    A.   My title is Strategy and Communications Consultant and I work in the  
8       Regulatory Department of Northern States Power Company. For the last 4  
9       years I held the position of Director, Regulatory Administration, for Xcel  
10      Energy Services Inc., and the Company, including its operations in South  
11      Dakota.

12

13   Q.   PLEASE SUMMARIZE YOUR QUALIFICATIONS AND EXPERIENCE.

14   A.   I graduated from the University of Minnesota in 1973 with a Bachelor of  
15      Science degree in Urban Studies and later a Masters degree in Business  
16      Administration from St. Thomas in 1991. As the Director of Regulatory  
17      Administration since April 2008, my job responsibilities included oversight of  
18      the development, preparation and support of all the Company's regulatory  
19      requests for approval needed for resource plans, resource acquisitions, power  
20      plants and transmission lines in Minnesota, South Dakota, North Dakota,  
21      Wisconsin and Upper Michigan. Throughout my 33 year tenure with the  
22      Company, I have been employed in various positions responsible for the  
23      routing and siting of new energy facilities such as transmission lines and power  
24      plants, as well as the acquisition of regulatory approvals, including Certificates  
25      of Need for those facilities. Since 1994, I have been extensively involved in

1 the development of the Company's resource plans and have represented the  
2 Company before state regulators in various resource planning and Certificate  
3 of Need proceedings. My resume is included with my testimony as  
4 Exhibit\_\_\_(JRA-1), Schedule 1.

5  
6 Q. FOR WHOM ARE YOU TESTIFYING?

7 A. I am testifying on behalf of Northern States Power Company, a Minnesota  
8 corporation operating in South Dakota (Xcel Energy or the Company). The  
9 Company is a wholly owned utility operating company subsidiary of Xcel  
10 Energy Inc.

11

12 **II. SUMMARY AND ORGANIZATION**

13 Q. WHAT IS THE PURPOSE OF YOUR TESTIMONY IN THIS PROCEEDING?

14 A. I respond to the issues raised by Staff outside witness Ms. Kavita Maini and:

- 15 • Explain that the Nobles Wind Project (Nobles Project) was selected as  
16 part of a comprehensive resource planning process;  
17 • Provide additional detail regarding the cost-effectiveness of the Nobles  
18 Project, demonstrating that it is a cost-effective addition to the resource  
19 base used to serve South Dakota customers; and  
20 • Explain how the operation of an integrated system benefits our South  
21 Dakota customers.

22

23 Q. WHAT GENERAL COMMENTS DO YOU HAVE ABOUT THE STAFF'S RATIONALE  
24 TO DISALLOW A PORTION OF THE NOBLES PROJECT COST?

1 A. As we understand Staff's rationale to disallow a portion of the Nobles Project,  
2 we believe it is inconsistent with important principles of efficient and effective  
3 resource planning and integrated system design and operation. Further, we  
4 provide additional information that confirms that Nobles is a cost effective  
5 resource for South Dakota customers, indeed all customers served by the  
6 integrated system. The balance of my testimony provides more detail on these  
7 points, but for now I summarize them as follows:  
8

9 The Company operates a fully integrated generation and transmission system  
10 under which all of our generation is used to meet system needs. Our large,  
11 integrated system allows us to:

- 12 • Reduce the total amount of generating resources used to reliably serve  
13 customers;
- 14 • Diversify the fleet of generating resources required to meet our  
15 customers' needs, lowering costs and risks; and,
- 16 • Lower costs by spreading costs over a substantially larger customer  
17 base.

18  
19 As such it is not appropriate for any one jurisdiction to carve out elements of  
20 the integrated system that, based on a stand-alone view, it sees as  
21 incrementally more or less beneficial to customers in that jurisdiction.  
22

23 Consistent with this system approach, the forecast used to determine the  
24 system's renewable resource needs includes our customers' needs in  
25 Minnesota, Michigan, North Dakota, South Dakota and Wisconsin. In  
26 determining these needs:

- 1       • We forecast the number of customers and MWh sales by customer
- 2       class for each of the five state jurisdictions separately and then
- 3       aggregate them.
- 4       • We then compare the forecasts of energy and peak demand
- 5       requirements to the generation resources available.
- 6       • When we have identified a need for additional resources on our system,
- 7       we evaluate the cost effectiveness of adding resources to meet that
- 8       need.

9

10      Our resource planning process is described in detail in a later section. This

11      process led us to the step of seeking proposals for a wind resource, which led

12      to receiving the Nobles Project proposal. As with all potential resource

13      additions, a critical aspect of our evaluation was Strategist modeling analyses

14      to determine whether Nobles would be a cost-effective resource. We modeled

15      the Nobles Project using two approaches:

16      First, under a very conservative analysis, Nobles was treated as being added

17      after an additional 2000 MW of new wind was added. This made Nobles the

18      last wind generation added to meet the full system renewable obligations and

19      goals in the analysis. Nobles was, however, one of the first additions to the

20      system. As a consequence of modeling Nobles last, Nobles was pushed

21      deeper into the economic dispatch stack.

- 22      • The energy that Nobles avoided in the simulation was from units that
- 23      are less costly to operate than the units Nobles actually displaces.
- 24      • This conservative modeling approach penalized the Nobles generation
- 25      by allowing the 2000 MW of additional wind to meet renewables

1 requirements and objectives to be dispatched first, and did not capture  
2 the benefits of the higher avoided costs Nobles provides.

- 3 • The end result of that modeling presented Nobles in a worst case light  
4 and did not reflect the true value provided by the Project. Despite this  
5 worse case view, the cost impact of adding Nobles was within 0.11  
6 percent of the No- Build alternative.

7 This was the Strategist analysis used by Staff witness Ms. Maini in her  
8 recommendation to disallow costs in excess of benefits. This is not the best  
9 Strategist analysis to use if Nobles is to be evaluated on a standalone basis. In  
10 addition, neither this conservative analysis nor Ms. Maini's recommendation  
11 took into consideration:

- 12 • the additional \$600,000 in benefits to South Dakota customers from the  
13 bonus depreciation tax law changes;
- 14 • or the loss of Production Tax Credit ("PTC") and Renewable Energy  
15 Credit ("REC") benefits to South Dakota customers if Nobles costs are  
16 disallowed.

17 Under the second Strategist modeling conducted by the Company, the  
18 Nobles project was credited with the higher avoided cost benefits that result  
19 from being one of the first wind projects added to our system. Under this  
20 analysis, the net benefit to customers is approximately \$80 million. This is  
21 the more appropriate Strategist modeling to use if Nobles is to be evaluated  
22 as a standalone addition, as Ms. Maini has.

23  
24 The Company has also conducted a market analysis using Midwest  
25 Independent System Operator ("MISO") energy costs for the purpose of  
26 comparing the cost of Nobles to the costs of replacement energy from the

1 MISO market. That analysis demonstrates that Nobles provides energy at a  
2 below market cost to the significant benefit of our customers.

3  
4 Ms. Maini also proposes disallowing the portion of the Nobles Project costs  
5 that were higher than the costs estimated at the time of the Strategist  
6 modeling. The incremental costs were the Company's costs not included in  
7 the build transfer development agreement with the developer. Those were  
8 prudent costs, most of which would have been incurred by any other  
9 alternative, and therefore, did not affect Nobles competitiveness against other  
10 alternatives. Further, it is not reasonable to disallow the prudent incremental  
11 costs incurred to bring Nobles on line. Nor is Ms. Maini's suggestion accurate  
12 that the incremental construction costs would not be recovered if a PPA had  
13 been used. As I indicated, the incremental costs were incurred directly by the  
14 Company to oversee the construction of the Nobles Project and most of  
15 those incremental costs would have been incurred had there been a PPA.

16  
17 **III. RESOURCE PLANNING**

18 Q. HOW WAS THE NOBLES PROJECT SELECTED AS A RESOURCE?

19 A. The Nobles Project was selected as part of a comprehensive resource planning  
20 process.

21  
22 Q. PLEASE DESCRIBE IN GENERAL TERMS THE COMPANY'S RESOURCE PLANNING  
23 PROCESS.

24 A. The Company conducts its resource planning process as an ongoing iterative  
25 process that has as its primary goal the development of a reasonable portfolio

1 of generating resources to meet overall needs, within the public policy  
2 frameworks of the States we serve, as cost effectively as reasonably possible.

3 The process is iterative because:

- 4 • our customers' needs for demand and energy change with the economy;
- 5 • the best means by which to meet those needs change depending on a  
6 host of factors, including:
  - 7 ○ the MISO market cost of energy;
  - 8 ○ the cost of alternative fuels;
  - 9 ○ changes in environmental regulation; and
  - 10 ○ the cost of different generation alternatives which can change for  
11 a number of reasons including changes in global demand for  
12 cement and steel.

13  
14 Q. PLEASE EXPLAIN THE COMPANY'S USE OF THE STRATEGIST MODELING  
15 ANALYSIS IN THE RESOURCE PLANNING PROCESS.

16 A. As one component of the resource planning process, the Company utilizes the  
17 Strategist model to evaluate potential resource needs under a variety of  
18 assumed conditions and sensitivities. The Strategist modeling analysis  
19 simulates operation and expansion of the portfolio of the generation resources  
20 needed to reliably meet the demand for electricity over the long term. The  
21 analysis allows us to compare potential costs and benefits of different  
22 generation choices and explore the impact of different assumptions about the  
23 future. Since major power plant additions are long-lived assets, the model  
24 estimates the impact of generating choices on the cost of electricity over an  
25 extended period of time. Strategist modeling is, however, only a tool and does  
26 not replace the need for professional judgment based on all available

1 information, and weighing all potential risks and benefits when making  
2 resource decisions.

3

4 Q. MS. MAINI TESTIFIES THAT THE COMPANY DID NOT NEED TO ADD NOBLES TO  
5 MEET THE SOUTH DAKOTA RENEWABLES OBJECTIVE. WHY DID THE  
6 COMPANY DECIDE TO ADD THE NOBLES PROJECT ?

7 A. The Company added Nobles because it provides cost-effective energy  
8 consistent with the system renewable energy policies and our goal to keep the  
9 cost of electricity low. It is not correct to treat Minnesota's renewable energy  
10 policy as the sole motivation for the addition of the Nobles Project.

11

12 Q. HOW DOES THE RESOURCE PLANNING PROCESS ADDRESS THE FACT THAT  
13 SOME OF THE STATES IN WHICH THE COMPANY OPERATES HAVE RENEWABLES  
14 OBJECTIVES RATHER THAN REQUIREMENTS?

15 A. The NSP system has historically been designed and operated as an integrated  
16 system regardless of where generation units are located or where the  
17 customers are located across the five states that NSPM serves. As a result,  
18 NSPM did not pick and choose certain resources or certain loads to include in  
19 the modeling of the Nobles Project. Rather, the forecast used to determine  
20 the system's resource needs includes our customers' needs in Minnesota,  
21 Michigan, North Dakota, South Dakota and Wisconsin. In determining these  
22 needs, we forecast the number of customers and MWh sales by customer class  
23 for each of the five state jurisdictions separately and then aggregate them. We  
24 then compare the forecasts of energy and peak demand requirements to the  
25 generation resources available. When we have identified a need for additional

1 resources on our system under those assumptions, we evaluate the cost  
2 effectiveness of adding resources to meet that need.

3  
4 In the case of the Nobles project, we were able to add a generating resource  
5 that will lower the production cost of electricity and comply with the policies  
6 set by all of the States in which we provide service. Since the cost and  
7 benefits of the entire system flow to all customers, it is very difficult to pick  
8 and choose only certain generation sources or to selectively isolate the costs  
9 and benefits of certain generation sources.

10  
11 Q. MS. MAINI ARGUES THAT A DISALLOWANCE IS APPROPRIATE IN PART BECAUSE  
12 NOBLES WAS NOT NEEDED TO MEET SOUTH DAKOTA'S RENEWABLE GOALS.  
13 PLEASE RESPOND.

14 A. We do not view the South Dakota goal of serving 10 percent of our retail  
15 needs with renewable resources as a requirement regardless of cost nor as a  
16 cap on the amount of renewable resources we can add if adding more will be  
17 cost effective.

18  
19 To determine our goals for renewables, we evaluate each jurisdiction's retail  
20 sales separately and calculate that jurisdiction's renewable potential  
21 requirements and goals based on its specific law. We compare those  
22 requirements against available renewable energy production to determine if  
23 additional resources may be needed and we examine the cost effectiveness of  
24 renewable-based generation additions. If our resource planning indicates that  
25 renewable energy additions have the potential to be cost effective, we then use  
26 competitive acquisition processes to obtain actual proposals from developers.

1

2 Q. IN ADDITION, MS. MAINI BASES HER RECOMMENDATION THAT ALL OR A  
3 PORTION OF THE COST OF THE NOBLES WIND PROJECT SHOULD BE DENIED  
4 BECAUSE NOBLES WAS NOT CONSTRUCTED TO FULFILL A CAPACITY OR ENERGY  
5 NEED. DO YOU AGREE THAT NSPM COULD MEET THE ENERGY NEEDS OF  
6 THE SYSTEM FROM OTHER GENERATION RESOURCES?

7 A. Yes, but that is not the appropriate question to ask. Ms. Maini appears to  
8 focus on the development of generation for reliability purposes and to ignore  
9 the independent need to provide economic energy. In its daily operations  
10 NSP decides if it should burn coal or natural gas to produce electricity or buy  
11 from the market. This daily and hourly decision is an economic dispatch  
12 process and not a reliability issue. The Company has numerous options or  
13 methods to satisfy the on-going energy needs of the system, such as burning  
14 coal, natural gas, buying energy in the market, or buying wind energy. The  
15 decision on which fuel or source of energy to use to meet the daily needs of  
16 the system is an economic decision that results in real costs and real avoided  
17 costs. Wind energy, like any other source of energy, be it coal or gas, has a  
18 real cost and a real value to the system that needs to be considered even  
19 though it does not provide additional capacity and other resources could have  
20 supplied the energy.

21

22 As we demonstrate below, the addition of the Nobles Project is a cost-  
23 effective resource for all of our customers.

24

25 **IV. COST COMPARISON OF NOBLES TO OTHER RESOURCES**

1 Q. PLEASE DESCRIBE THE COMPANY'S ANALYSIS OF THE COST OF NOBLES AT THE  
2 TIME IT WAS SELECTED.

3 A. Major power plant additions like Nobles are long lived. Consequently, their  
4 cost effectiveness must be judged based on estimates of performance  
5 compared to the alternatives over a 25 year or longer period into the future.  
6 When we explored various assumptions about the future, the costs of the  
7 Nobles Project were within a reasonable range of nonrenewable alternatives at  
8 the time it was selected, under very conservative assumptions and was a lower  
9 cost alternative under more refined assumptions.

10

11 Q. PLEASE EXPLAIN HOW THE SELECTION OF THE NOBLES PROJECT WAS  
12 DEVELOPED IN THE COMPANY'S RESOURCE PLANNING AND ACQUISITION  
13 PROCESS.

14 A. Our Resource Planning work first examined whether compliance with the  
15 combined renewable energy requirements of the States we serve might be cost  
16 effective. Our analysis indicated that additional increments of wind power  
17 could be cost effective depending on various assumptions about prices and  
18 federal renewable incentives. Our analysis also indicated that customers could  
19 benefit by adding wind resources owned by the company to diversify risk. As  
20 a result, proposals were sought from developers. Nobles was the most cost  
21 effective proposal received.

22

23 We then conducted two analyses, using Strategist, of the impact the addition  
24 of Nobles would have on the cost of electricity. Our first modeling looked at  
25 the role Nobles might perform as part of the full portfolio of wind generation  
26 needed to comply with state renewable policies through the year 2035. Rather

1       than look at Nobles as a standalone wind project we chose to model Nobles  
2       as if 2000 MW of additional wind generation had already been added and that  
3       the addition of 200 MW from Nobles would bring the total to the 2200 MW  
4       needed to meet our State renewable obligations and objectives. The model  
5       treated Nobles as the last project added to that fleet, rather than its actual  
6       position as one of the first new increments added.

7  
8       Q. PLEASE EXPLAIN THE BASIS FOR MODELING THE NOBLES PROJECT AS THE  
9       LAST ADDITION WHEN IT WAS ACTUALLY ONE OF THE FIRST.

10      A. This modeling approach provided a very conservative estimate of the cost-  
11      effectiveness of the Nobles Project. In the Company's resource selection  
12      process, we intentionally apply conservative assumptions. If the resource is  
13      still cost-effective under these conservative assumptions, it provides greater  
14      assurance that it is a good resource for our customers.

15  
16      The relative position of Nobles in the sequence of adding resources is  
17      important because the addition of wind displaces energy production from  
18      other sources, such as natural gas and coal. Consistent with the economic  
19      dispatch of resources, the first additions of wind will displace the highest cost  
20      alternatives—historically, natural gas. As more wind is added, the later added  
21      resources will displace other resources with lower operating costs. Thus, in  
22      comparing the cost-effectiveness of the Nobles Project against other  
23      resources, the model assumed that the highest cost resources had already been  
24      displaced by other wind additions when, in fact, the Nobles Project will be  
25      used to displace resources with higher operating costs.

26

1 Q. HOW COMPETITIVE IS NOBLES UNDER THE COMPANY'S FIRST, CONSERVATIVE  
2 APPROACH TO STRATEGIST MODELING?

3 A. The results were very competitive. If the Company's conservative modeling  
4 were the sole test, the addition of Nobles was slightly more expensive but  
5 within 0.11 percent of the cost of the scenario in which it was not added.  
6

7 Q. PLEASE ADDRESS MS. MAINI'S CONCLUSION THAT THE PROJECT WAS NOT  
8 COST-EFFECTIVE BASED ON THIS CONSERVATIVE MODELING.

9 A. The conservative analysis described above indicated that Nobles was cost  
10 competitive, that is, power supply costs simulations were within 0.11 percent  
11 of the no build alternative. We also knew that the modeling did not capture  
12 all of the potential benefits of a wind addition. We used the conservative  
13 analysis as the basis for our Minnesota filing because we wanted to  
14 demonstrate the cost effectiveness of meeting all of our renewable obligations  
15 and goals. It appears Ms. Maini is applying a "least cost" standard as the basis  
16 for her recommendation. The numbers in the Minnesota filing, on their face,  
17 do not demonstrate least cost. Rather, they demonstrate that the project was  
18 very competitive even when evaluated on a worst case basis.  
19

20 Q. PLEASE COMMENT ON THE RELIABILITY OF A LEAST-COST APPROACH.

21 A. Such an approach does not consider the inherent uncertainty around the  
22 results of a long-term simulation like that using Strategist nor the uncaptured  
23 benefits. Attempting to identify isolated costs and/or benefits of specific  
24 generation sources at any point in time is very difficult because these costs and  
25 benefits will change as the energy markets change over time.  
26

1 Q WHAT WERE THE POTENTIAL BENEFITS THAT WERE NOT CAPTURED IN THE  
2 CONSERVATIVE MODELING?

3 A. The analysis assumed the Nobles Project will be replaced in 25 years. If the  
4 life of the project is extended without the need for major capital investments  
5 or significant increases in O&M costs, the effective cost of energy from  
6 Nobles will be less than that assumed in the analysis. Furthermore, since  
7 Nobles is a Company owned resource, any changes in tax incentives or other  
8 financial benefits are considered in ratemaking and can be used to the benefit  
9 of customers to keep rates lower. For example, since the time of the original  
10 present value analysis, federal corporate income tax changes were put in place  
11 that allow for accelerated or bonus depreciation calculations. The effect of  
12 bonus depreciation provisions of the tax code will be to reduce income taxes  
13 and the present value associated with the Nobles project has been reduced by  
14 approximately \$600,000 for our South Dakota customers<sup>1</sup>. That direct benefit  
15 to customers was not captured in the analysis.

16  
17 Q. WAS THE CONSERVATIVE ANALYSIS DESCRIBED SO FAR THE ONLY ANALYSIS  
18 THE COMPANY UNDERTOOK?

19 No. We also did analysis to examine the incremental impact of adding the  
20 Nobles project. Instead of assuming 2000 MW of wind power would have  
21 already been added to comply with renewable energy requirements, we  
22 constructed a scenario in which no additional wind power other than Nobles  
23 was added to the system. Changing the analysis so that only existing  
24 renewable resources are considered when adding Nobles indicated that the

---

<sup>1</sup> Schedule 4 provides the calculation of the \$600,000 in revenue requirement offsets.

Nobles Project will provide a cost savings to all customers. As presented in Table 1 below, the less conservative incremental analysis shows that Nobles results in a reduction in the present value of revenue requirements ("PVRR") of \$80 million, assuming a \$17/ton carbon cost. A \$4/ ton future carbon cost, as suggested by Ms. Maini, results in customer savings from the addition of Nobles of approximately \$22 million. Removing the impact of carbon costs completely from the analysis results in the Nobles project providing savings of nearly \$4 million.

Table 1

		CO2 \$17/ton	CO2 \$4/ton	No CO2 \$0/ton
Conservative analysis of full renewables compliance with incremental impact of Nobles		+\$64	+\$123	+\$140
Incremental analysis only looking at the addition of Nobles without any additional wind for future compliance.		(\$80)	(\$22)	(\$4)
1) Numbers are reported as present value of revenue requirements in millions				
2) (\$) indicates a system savings				

Q. HOW CAN REMOVING THE 2000 MW OF WIND MAKE SUCH A DIFFERENCE IN THE FINANCIAL ANALYSIS?

A. Since the conservative modeling convention that essentially put the 200 MW of Nobles wind after the 2000 MW of wind added to meet the all State renewable requirements, Nobles was pushed deeper into the economic dispatch stack. The energy that Nobles avoided in the simulation was from units that are less costly to operate. This conservative modeling approach

1 penalized the Nobles generation by allowing the 2000 MW of additional RES  
2 wind to be dispatched first, avoiding higher operating cost units and capturing  
3 the benefits of higher avoided cost. The end result of that modeling presented  
4 Nobles in a worst case light and did not reflect the true value provided by the  
5 project. The less conservative incremental modeling better reflects the true  
6 position of Nobles in dispatch and the impact of adding Nobles before or  
7 without any additional wind. The less conservative, incremental analysis still  
8 does not capture all the potential benefits associated with the project as  
9 previously described. But even without consideration of those uncaptured  
10 benefits, the incremental analysis demonstrates that Nobles is not only cost  
11 competitive but also meets a least-cost standard regardless of your view of the  
12 risk of future carbon regulation. The addition of Nobles was a prudent  
13 investment on behalf of our ratepayers and will, over time, result in lower  
14 energy costs from our system.

15  
16 Q. ARE THERE OTHER WAYS FOR THE COMPANY TO EVALUATE THE COST-  
17 EFFECTIVENESS OF A RESOURCE LIKE THE NOBLES PROJECT?

18 A. Yes. In addition to the Strategist modeling, NSP also compares the cost of  
19 energy from a proposed resource to the cost of energy in the general MISO  
20 market. When analyzing the system as a whole, Strategist provides an analysis  
21 of the costs and benefits of a new generation resource in comparison to the  
22 dispatch of all of the resources of the NSP generation fleet. To see how the  
23 resource would fair in the MISO market, NSP can also compare the cost of  
24 energy from the new generation source to a forecast of the energy cost from  
25 the MISO market over the life of the project.

PUBLIC

1

2 Q. HAS THE COMPANY COMPLETED SUCH A COMPARISON OF THE NOBLES  
3 PROJECT TO THE FORECAST OF THE ENERGY COST FOR MISO OVER THE LIFE  
4 OF THE PROJECT?

5 A. Yes. An analysis comparing the expected cost of the Nobles Project to a  
6 forecast of the energy prices for MISO from October 2008 is presented in  
7 Exhibit \_\_\_\_ (JRA-1), Schedule 2 to my testimony. This analysis shows that  
8 based on the October 2008 energy price forecast for MISO the cost of the  
9 energy displaced by the energy produced by the Nobles Wind project would  
10 have cost approximately **CONFIDENTIAL DATA BEGINS**  
11 **[** **CONFIDENTIAL DATA ENDS** on a levelized energy cost  
12 basis. This is higher than the comparison cost of the Nobles Project of  
13 **CONFIDENTIAL DATA BEGINS [** **CONFIDENTIAL**  
14 **DATA ENDS**. It should be noted that the cost comparison to the MISO  
15 market forecast does not take into consideration any avoided carbon cost, or  
16 capacity value. Based on this analysis of the expected value of the Nobles  
17 Wind project in MISO, the project was cost effective.

18

19 Q. MS. MAINI DISAGREES WITH THE COMPANY'S USE OF A \$17/TON CARBON  
20 REGULATION COST OF THE ALTERNATIVE TO NOBLES. WHY WERE THE COSTS  
21 OF GREENHOUSE GAS EMISSIONS CONSIDERED IN THE EVALUATION OF  
22 NOBLES?<sup>2</sup>

---

<sup>2</sup> Ms. Maini's testimony states that we used \$17.50/ton. As we indicated in our response to data request 4-8, we actually used \$17/ton in the Strategist modeling.

1

2 A. It would be imprudent not to include reasonable estimates of future carbon  
3 dioxide regulation costs when evaluating new generation. The evaluation of  
4 proceeding with a Company-owned wind resource was first presented with the  
5 2007 resource plan. In section 11 of that plan, we identified that there were  
6 several proposals for greenhouse gas regulation both at the state and federal  
7 levels, particularly with respect to carbon, on the state and federal level. I  
8 include a copy of section 11 of the 2007 resource plan submitted in MPUC  
9 Docket No. E002/RP-07-1572 as Exhibit \_\_\_\_ (JRA-1), Schedule 3.

10

11 Q. WHY DID THE COMPANY USE \$17/TON TO EXAMINE THE RISK OF CARBON  
12 REGULATION.?

13 A. Based on what was known at the time of our selection, we did not believe a  
14 scenario based on \$4/ton was a reasonable representation of the impact of  
15 future carbon regulation. Based on extensive testimony before the Minnesota  
16 Public Utilities Commission in 1996, the future cost of carbon regulation was  
17 predicted to fall within a range of \$4 to \$30.<sup>3</sup> As Ms. Maini indicated, the  
18 Company used the middle of that range in its analysis.

19

20 The Company used the middle of the range not because the range was  
21 approved by the Minnesota Public Utilities Commission. Rather, we used the  
22 middle of the range because it is supported by the expert testimony in that  
23 proceeding. In addition, at the time we made the decision to pursue Nobles,  
24 there was active legislation in Congress to implement carbon regulation and

---

<sup>3</sup> MPUC Docket No. E999/CI-93-583.

1 the range being discussed at that time was in the \$12 to \$21 range. Therefore,  
2 \$17/ton was a reasonable amount to include to capture the risk of future  
3 carbon regulation costs.

4

5 Q. WOULD \$4/TON BE AN ADEQUATE RISK ESTIMATE OF FUTURE CARBON COSTS?

6 A. No. It is at the bottom of the range established in 1996 and is well below  
7 carbon costs anticipated at the time we conducted the analysis in 2008 that  
8 resulted in selecting the Nobles Project. A \$4/ ton scenario did not  
9 adequately capture the risk of increased cost of the alternative to Nobles and  
10 based on what was known at the time underestimates the risk mitigation  
11 benefits associated with a windpower addition.

12

13 Q. PLEASE EXPLAIN HOW THE COST EFFECTIVENESS OF NOBLES SHOULD BE  
14 EVALUATED.

15 A. No single Strategist modeling scenario can precisely predict the future. The  
16 work presented in our Minnesota submission demonstrates that Nobles is cost  
17 competitive under a wide range of assumptions. The less conservative  
18 incremental analysis better captures the role Nobles will play in our resource  
19 mix and demonstrates Nobles is not only cost competitive but can lower costs  
20 for our customers. In addition, a comparison of Nobles to predictions of  
21 market prices for energy indicates that Nobles is a cost effective resource  
22 addition to our system.

23

24 Q. WHAT ARE THE NOBLES PROJECT COSTS THE COMPANY IS REQUESTING TO  
25 RECOVER?

1 A. The Company is requesting to recover the South Dakota jurisdictional portion  
2 of the actual Nobles construction costs, which translates into a revenue  
3 requirement of \$2.039 million. Ms. Maini proposes to cap recovery based on  
4 the estimated cost used at the time the Company conducted the Strategist  
5 modeling. This would reduce the associated revenue requirement to \$1.926  
6 million (a reduction of \$0.113 million). This adjustment is inappropriate.

7  
8 Q. WHY WERE THE ACTUAL COSTS HIGHER THAN THE ESTIMATED COST USED IN  
9 THE STRATEGIST MODELING?

10 A. Actual costs often vary from the estimated cost for large construction projects  
11 like the Nobles Project. In this case, the actual costs were within 2 percent of  
12 the estimated cost. The reason for the higher investment cost was that we  
13 performed our Strategist modeling using the cost of the contract with the  
14 developer. We did not include the associated costs the Company incurred for  
15 the Project. These costs included payments to landowners, compensation for  
16 crop damage, sales tax, builders risk insurance, transmission interconnection,  
17 title insurance, and project oversight and overheads. The omission of those  
18 costs did not materially affect the selection of Nobles because most of the  
19 costs would have been incurred by the other two competing wind projects.  
20 Nor was the change of a magnitude that it changed the cost-effectiveness of  
21 the Project.

22  
23 Q. WHY WOULD A RATE ADJUSTMENT BASED ON COSTS BEING HIGHER THAN  
24 ORIGINALLY ESTIMATED BE INAPPROPRIATE?

25 A. Utilities recover their actual cost of providing service. Just as we would have  
26 flowed through the savings if costs had been less, we are entitled to recover

1       our higher prudently incurred costs. In this case, the change in costs were all  
2       prudently incurred and necessary for the safe and efficient operation of  
3       Nobles. Ms. Maini has presented no information to the contrary. Because the  
4       Company was prudent in pursuing the Nobles project, and the incremental  
5       costs were prudently incurred to bring the project on line, there is no basis in  
6       law or policy to disallow recovery of these incremental costs.

7  
8       Q. IF THE COMMISSION ADOPTS MS. MAINI'S PROPOSAL TO DISALLOW COSTS IN  
9       EXCESS OF THE BENEFITS IDENTIFIED IN THE CONSERVATIVE SCENARIO FROM  
10      THE STRATEGIST MODEL, SHOULDN'T THESE HIGHER ACTUAL COSTS ALSO BE  
11      DISALLOWED?

12     A. No. The decision to proceed with the Nobles project should be evaluated  
13     separately from the recovery of the slightly higher actual cost. The  
14     incremental actual costs should be recoverable if they were prudently incurred,  
15     which they were.

16  
17     Q. MS. MAINI ARGUES THAT COST RECOVERY SHOULD BE CAPPED IN THE SAME  
18     MANNER AS A POWER PURCHASE AGREEMENT ("PPA"). DO YOU AGREE?

19     A. No. First, if the Company had used a PPA for Nobles instead of build  
20     transfer development arrangement, many of these incremental costs would  
21     still have been incurred. The original cost estimate was for the contractor's  
22     cost, and did not include the Company's costs. The Company would have still  
23     incurred many of these costs under a PPA scenario. If the developer rather  
24     than the Company had been responsible for some of the costs, such as the  
25     cost of interconnection and landowner costs, then the cost of the contract

1 with the developer would have been higher. Under any scenario, these were a  
2 prudent cost of the project and should be recovered in rates.

3

4 Second, as I noted earlier, our ownership of Nobles has brought more value  
5 to customers than our analysis suggested. Since the time of the original cost  
6 estimate and present value analysis, federal corporate income tax changes were  
7 put in place that allow for accelerated or bonus depreciation calculations. The  
8 effect of bonus depreciation provisions of the tax code will be to reduce the  
9 present value of revenue requirements associated with the Nobles project by  
10 approximately \$600,000 for our South Dakota customers. As a result of the  
11 build transfer development arrangement, and ultimately Company ownership  
12 of the project, that tax benefit will be enjoyed by our customers over the life  
13 of the project. This is in contrast to what would have happened under a PPA.  
14 I therefore disagree with Ms. Maini that a PPA risk approach is appropriate.  
15 Had we contracted for a PPA, the developer would have borne the risk of  
16 variances from the cost estimate, but would have also captured the  
17 unanticipated benefits, such as bonus depreciation.

18

19 Q. IF THE COMMISSION WERE TO DISALLOW A PART OF THE COST FROM NOBLES,  
20 SHOULD OTHER ADJUSTMENTS BE MADE?

21 A. Yes. If, for example, South Dakota elects to pay for only 70 percent of the  
22 cost of Nobles on the grounds that those costs were incurred to meet  
23 Minnesota requirements, then South Dakota should not receive a full share of  
24 the energy generated by Nobles. Thirty percent of the energy that would  
25 otherwise be allocated to the South Dakota Fuel Clause Rider from the

1 Nobles project would need to be replaced, presumably with MISO market  
2 based energy costs.

3  
4 Similarly, the opportunity to provide South Dakota customers any revenue  
5 from the sale of associated Renewable Energy Credits would be lost.

6  
7 Finally, 30 percent of the South Dakota share of project PTCs would also  
8 need to be reallocated to other jurisdictions. That would reduce PTC benefits  
9 to South Dakota customers by approximately \$275,000.

10  
11 **V. THE BENEFITS OF AN INTEGRATED SYSTEM.**

12 Q. PLEASE DESCRIBE WHAT YOU MEAN BY THE TERM "INTEGRATED SYSTEM."

13 A. By "integrated system," I mean the operation of our entire, multi-state system  
14 of generating, transmitting, and delivering electricity services to our customers.  
15 The Company provides electric service in five states in the upper Midwest,  
16 including Minnesota, Michigan, North Dakota, South Dakota, and Wisconsin.  
17 The Company's assets are all connected to an interconnected network of  
18 transmission lines that allow us to dispatch generation to the benefit of all  
19 customers.

20  
21 Q. WHAT ADVANTAGES DOES AN INTEGRATED SYSTEM OFFER?

22 A. Connection with this larger, regional network of assets allows us to plan and  
23 operate our entire five-state system on an integrated basis. That means, for  
24 example, that we can plan our fleet of generating plants on a total-system

1 basis, as opposed to attempting to plan on a state-by-state or community-by-  
2 community basis. A large, integrated system allows us to:

- 3 • Reduce the total amount of generating resources used to reliably serve  
4 customers.
- 5 • Diversify the fleet of generating resources required to meet our  
6 customers' needs, lowering costs and risks.
- 7 • Lower costs by spreading costs over a substantially larger customer  
8 base.

9  
10 Q. PLEASE EXPLAIN HOW AN INTEGRATED SYSTEM REDUCES THE TOTAL NEED  
11 FOR GENERATING RESOURCES.

12 A. A large, integrated system such as ours requires fewer total generating  
13 resources compared to several, smaller systems serving a similar number of  
14 customers. This result arises from our ability to take advantage of load  
15 diversity across a large number of customers and broad geographic area. For  
16 example, a system that combines the usage of relatively peak-sensitive, low  
17 load-factor customers with the usage of large, industrial customers with  
18 significant off-peak usage will require a lower total amount of generating  
19 capacity as compared to two separate systems serving each group. Generally  
20 speaking, the larger and broader the range of customers, the greater the  
21 diversity of their energy load and usage characteristics will be; and the greater  
22 the diversity of load, creating an advantage for generation planning.

23  
24 Q. PLEASE ELABORATE ON YOUR SECOND POINT REGARDING DIVERSITY OF  
25 GENERATING RESOURCES.

1 A. The more than 9,000 MW system such as ours provides the breadth and scope  
2 to support a variety of generating resources that could not otherwise be  
3 justified in a smaller system. Our generating fleet is among the most diverse in  
4 the nation and is powered by nuclear, coal, hydro, natural gas, oil, wind, and  
5 biomass -- even garbage. Such a diverse fuel mix allows us to not only reduce  
6 costs for customers, but also to diversify risk:

7  
8 **Figure 1: Xcel Energy's Portfolio of Resources**  
9 **percent of MW produced**

- 11  
12  
13  
14  
15  
16  
17  
18  
19  
20
- 21 • costs are lower, as we have sufficient scale to justify investments in base
  - 22 load nuclear and coal plants that reduce average costs to all customers;
  - 23 • risks are lower because we are not dependent on any one fuel source.
- 24

1 In times of significant fuel price volatility like we are currently experiencing, a  
2 diversified fuel mix provides a tremendous price hedge for our customers  
3 compared to an electric system dependent on only one or two fuel sources.  
4

5 Q. CAN YOU EXPLAIN YOUR THIRD POINT REGARDING REDUCED COSTS DUE TO A  
6 LARGER CUSTOMER BASE?

7 A. Yes. Operating an electric system requires certain basic infrastructure  
8 investments and services to simply run the business. Because such business  
9 costs can be spread over a larger customer base, the average cost of providing  
10 service is lower.  
11

12 Q. DO YOU BELIEVE XCEL ENERGY'S INTEGRATED SYSTEM HAS PROVIDED  
13 BENEFITS SUCH AS THOSE YOU DESCRIBE TO SOUTH DAKOTA CUSTOMERS?

14 A. I believe there can be no question that our five-state, integrated system offers  
15 tremendous benefits to our customers.  
16

17 Q. ARE THERE ANY PARTICULAR ADVANTAGES TO SOUTH DAKOTA CUSTOMERS  
18 DUE TO XCEL ENERGY'S INTEGRATED SYSTEM?

19 A. Yes. The smaller jurisdictions of our five-state service territory enjoy the  
20 greatest benefits from being part of a larger system. Our South Dakota load  
21 accounts for approximately 400 MW of the more than 9,000 MW system. To  
22 meet the needs of this size load on a stand-alone basis, we would likely need  
23 to rely on either natural gas generation or a smaller coal plant supplemented  
24 with purchased power – there would certainly be no way to support the broad,  
25 diverse portfolio of resources currently serving our system.  
26

1 Q. CAN YOU ELABORATE FURTHER ON THESE OVERALL BENEFITS?

2 A. Yes. The resource options that are available to a large integrated system such  
3 as ours are numerous and are due in large part to the overall size of the  
4 customer base we serve. As a more than 9,000 MW system, we can consider  
5 large resource additions of significant size to take full advantage of the  
6 economies of scale available through large facility generation. For example,  
7 the recent addition of 515 MW at the new High Bridge facility could not have  
8 easily been absorbed into a smaller, stand-alone system. The fuel efficiency of  
9 the combined cycle units now available at the new High Bridge facility  
10 represents a 45 percent advantage compared to the addition of a smaller,  
11 simple cycle turbine. Based on current fuel prices, this translates into a cost  
12 savings of \$10/MWh or \$15 million per year in savings for all of our  
13 customers.

14

15 Similar advantages are made available due to the load diversity on our system.  
16 Our overall system diversity factor is 59.7%. This means that 60% of our load  
17 occurs in the on-peak period. While some large integrated systems  
18 throughout the country may have similar system diversity factors, it is quite  
19 difficult for smaller systems to achieve this level of diversity. This means that,  
20 for these smaller systems, a larger percentage of their load will be exposed to  
21 on-peak market prices a larger percentage of the time than would be the case  
22 for larger systems. Given that on-peak prices for energy in our region are  
23 currently twice off-peak prices, this is a significant benefit for larger, integrated  
24 systems.

25

1 Finally, the Company has built a highly diverse fleet of generation and load  
2 management resources. My above Figure 1 provides a summary of the relative  
3 contributions from all of our resources to meeting the needs of our customers.  
4 It is obvious from this graph that the Company has limited its exposure to  
5 price volatility from any single resource.

6  
7 Q. PLEASE ELABORATE ON THE BENEFITS OF A LARGE INTEGRATED SYSTEM FROM  
8 A RESOURCE ACQUISITION PERSPECTIVE.

9 A. When the Company wishes to acquire new generation resources, it can issue  
10 RFPs for new resources exceeding 150 MWs in size. RFPs of this magnitude  
11 are sufficient to draw the attention of large power plant developers with  
12 resources to bring large projects on-line in a timely manner, assuming the  
13 numerous risks that are present in power plant development. The Company  
14 can also weigh these offers against large Company-owned projects that  
15 provide other advantages. It would be difficult for a smaller stand-alone  
16 system to participate effectively in this market.

17  
18 There are also advantages to size in the mid- and short-term power acquisition  
19 markets that the Company must operate in to meet customers' needs. The  
20 Company has developed extensive energy trading and risk management  
21 expertise to better serve our customers in the mid-term markets and the day-  
22 ahead and real-time markets facilitated by MISO. It would be nearly  
23 impossible for a smaller stand-alone entity to cost-effectively develop the  
24 expertise needed to participate in these markets.

25

1 Q. PLEASE SUMMARIZE YOUR CONCLUSIONS REGARDING THE BENEFITS TO ALL  
2 CUSTOMERS OF BEING PART OF A LARGE INTEGRATED SYSTEM.

3 A. There are significant advantages because of our size that result primarily from  
4 the existence of economies of scale in the electric power industry. I have  
5 attempted to provide examples of these advantages, based on my experience  
6 in system planning and resource acquisition. While some advantages are more  
7 difficult to quantify, I believe that my discussion demonstrates the overall  
8 advantages of participation in a large integrated system compared to system  
9 planning and resource acquisition on a stand-alone basis.

10

11 Q. PLEASE COMPARE THESE ADVANTAGES TO THE PROPOSAL IN THIS CASE TO  
12 DISALLOW ALL OR A PORTION OF THE COST OF NOBLES?

13 A. The Direct Testimony of Ms. Maini challenges the fundamental premise of an  
14 integrated system: instead of recommending acceptance of a proportionate  
15 share of our total system costs, Ms. Maini recommends significant  
16 disallowances because Nobles was acquired to meet system renewable  
17 resource needs rather than South Dakota standalone needs. At least part of  
18 the basis of this recommendation is disagreement that South Dakota  
19 customers should pay a share of the costs of meeting certain Minnesota  
20 requirements. The problem with this approach is that once we begin to  
21 disaggregate total system costs in any way other than proportionately across  
22 our entire system, we will quickly lose the very nature and benefits of an  
23 integrated system.

24

1 Q. MS. MAINI INDICATES THAT THE COSTS OF RENEWABLES COMPLIANCE SHOULD  
2 BE RECOVERED BY JURISDICTION, SIMILAR TO COST RECOVERY FOR ENERGY  
3 EFFICIENCY PROGRAMS. DO YOU AGREE?

4 A. No. The costs of energy efficiency programs are paid for by ratepayers in the  
5 discrete jurisdictions but those ratepayers are also the only ones eligible to  
6 participate in the programs they pay for.

7

8 Q. DO THE ENERGY EFFICIENCY PROGRAMS PAID FOR IN ONE STATE BENEFIT  
9 CUSTOMERS IN OTHER STATES?

10 A. Yes. In all of our NSPM jurisdictions, the Company has had the longest-  
11 running and most funded conservation program in Minnesota pursuant to  
12 Minn. Stat. § 216B.241, which sets forth a minimum spending requirement for  
13 utilities in Minnesota. Our Minnesota customers in 2010 paid \$71.9 million  
14 for conservation improvement programs and incentives that are wholly  
15 recovered from Minnesota ratepayers. In contrast, conservation investment in  
16 South Dakota is much more limited. Our expanded conservation program in  
17 South Dakota was approved late in 2011 and our related tariffs went into  
18 effect just this year. In contrast, the Minnesota ratepayers funded 115,530 kW  
19 and 415,591,395 kWh in avoided demand and energy in 2010. The resulting  
20 cost benefits from the avoided demand and energy are not allocated just to  
21 Minnesota. Instead those savings are reflected in a lower cost generation  
22 portfolio that benefits all of our customers. If South Dakota were to disallow  
23 cost recovery for a portion of our generation that it would prefer Minnesota  
24 customers pay for, it is reasonable to expect Minnesota regulators to consider  
25 their own disaggregated interests.

## VI. CONCLUSION

Q. PLEASE SUMMARIZE YOUR TESTIMONY?

A. The Nobles Project is an important part of our strategy to meet our renewable energy obligations in a cost-effective manner:

- It, along with the rest of our renewable based portfolio of generation, meets our customers' electricity requirements cost effectively while satisfying public policy directives.
- Using conservative Strategist modeling in which Nobles was treated as the being added after an additional 2000 MW of new wind, it was within 0.11 percent of the no build alternative.
- Using an incremental Strategist modeling approach in which Nobles was recognized as the next unit of wind to be added, the Nobles project reduces the cost of energy.
- Similarly, when a market analysis is used to determine the cost/benefit of Nobles, it lowers the cost of Nobles significantly, making it a fully competitive resource alternative.
- When the additional benefits from the bonus depreciation income tax change is considered along with the reduced South Dakota share of PTCs, RECs and free energy that would result from any cost disallowance the benefits from Nobles become even greater.
- In addition, the benefits to South Dakota as a full participant in our large integrated system more than offset any added costs associated with including Nobles in our portfolio.

1       It is also not reasonable to disallow the prudent incremental costs incurred to  
2       bring Nobles on line. Nor is the suggestion accurate that the incremental  
3       construction costs would not be recovered if a PPA had been used. The  
4       incremental costs were incurred directly by the Company to oversee the  
5       construction of the Nobles Project and most of those costs would also have  
6       been incurred had there been a PPA.

7

8       Therefore, the Commission should approve full cost recovery for the Nobles  
9       project.

10

11    Q. DOES THIS CONCLUDE YOUR TESTIMONY?

12    A. Yes.
