

**BEFORE THE PUBLIC UTILITIES COMMISSION  
OF THE STATE OF SOUTH DAKOTA**

**IN THE MATTER OF THE APPLICATION BY SWEETLAND WIND FARM, LLC  
FOR FACILITY PERMITS OF A WIND ENERGY FACILITY AND A 230-KV  
TRANSMISSION FACILITY IN HAND COUNTY, SOUTH DAKOTA FOR THE  
SWEETLAND WIND FARM PROJECT**

**SD PUC DOCKET EL 19-\_\_\_\_**

**PRE-FILED DIRECT TESTIMONY OF TODD MABEE  
ON BEHALF OF SWEETLAND WIND FARM, LLC**

March 6, 2019

1 **I. INTRODUCTION AND QUALIFICATIONS**

2

3 **Q. Please state your name, employer, and business address.**

4 A. My name is Todd Mabee. I am employed at Western EcoSystem Technology,  
5 Inc. ("WEST"), 2725 NW Walnut Blvd., Corvallis, OR 97330.

6

7 **Q. Briefly describe your educational and professional background and duties.**

8 A. I am a senior ecologist with WEST. I have a Bachelor of Arts in Population and  
9 Organismic Biology from the University of Colorado and a Master of Science in  
10 Zoology from Colorado State University. I have more than 30 years of  
11 experience as a terrestrial ecologist conducting field studies for a variety of  
12 industry sectors, including renewable energy, oil and gas, and timber. During my  
13 career, I have worked extensively on avian and bat issues at renewable projects  
14 in the United States and Mexico. A copy of my resume is attached as **Exhibit**  
15 **A6-1.**

16

17 **Q. What is your role with respect to the Sweetland Wind Farm and associated**  
18 **transmission line (together, the "Project")?**

19 A. WEST was engaged by Sweetland Wind Farm, LLC ("Sweetland"), to conduct  
20 certain environmental surveys and studies for the Project.

21

22 **Q. In the event you are not available to testify, is there another individual**  
23 **qualified to discuss the information in your testimony?**

24 A. Yes, Ms. Joyce Pickle, research biologist with WEST, and Mr. Kenton Taylor,  
25 ecologist/senior manager at WEST, are each qualified to discuss the information  
26 in my testimony. Detailed information regarding Ms. Pickle's and Mr. Taylor's  
27 qualifications and experience is included in their resumes, attached as **Exhibits**  
28 **A6-2** and **A6-3**, respectively.

29

30 **II. PURPOSE OF TESTIMONY**

31

32 **Q. What is the purpose of your Direct Testimony?**

33 A. The purpose of my Direct Testimony is to describe the environmental surveys  
34 and studies conducted by WEST for the Project.

35

36 **Q. Please identify which sections of the Application you are sponsoring for  
37 the record.**

38 A. I am sponsoring the following sections of the Application:

- 39 • Section 13.1: Vegetation
- 40 • Section 13.2: Wildlife
- 41 • Appendix E: Native Grasslands Habitat Report
- 42 • Appendix F: Presence/Absence Surveys for Northern Long-Eared Bat
- 43 • Appendix G: Whooping Crane Habitat Review
- 44 • Appendix H: Eagle and Raptor Nest Surveys
- 45 • Appendix I: Avian Use Surveys
- 46 • Appendix J: Acoustic Bat Surveys

47

48 **III. ENVIRONMENTAL STUDIES AND SURVEYS CONDUCTED BY WEST**

49

50 **Q. Describe the environmental studies and surveys conducted by WEST for  
51 the Project.**

52 A. As described in more detail in the Application, WEST conducted the following  
53 environmental studies and surveys for the Project: Native Grasslands Habitat  
54 Report (Appendix E); Bat Summer Presence/Absence Survey Report (Appendix  
55 F); Whooping Crane Stopover Habitat Assessment Report (Appendix G); Eagle  
56 and Raptor Nest Surveys 2017 (Year 1) Report and Eagle and Raptor Nest  
57 Surveys 2018 (Year 2) Report (each included in Appendix H); Baseline Avian  
58 Study, Year 1 Report (Appendix I); and Bat Activity Study 2017 Report and Bat  
59 Activity Study 2018 Report (each included in Appendix J). In addition, WEST is  
60 assisting Sweetland with the preparation of the Project's Bird and Bat  
61 Conservation Strategy ("BBCS").

62

63 **Q. What vegetation is present within the Study Area?**

64 A. Herbaceous/grassland (51.9 percent), cultivated crop (24.2 percent), and  
65 hay/pasture (19.2 percent) compose the majority of the land cover/land use  
66 within the Project Area, while the remaining land use/land cover makes up 4.7  
67 percent of the Project Area.

68

69 As described in more detail in Section 13.1 of the Application, a site-specific  
70 grassland habitat assessment of the Study Area was conducted between July 17  
71 and September 14, 2018, to provide an assessment of the quality of all Project  
72 grasslands, both disturbed and previously undisturbed (Appendix E) and to  
73 therefore provide information to the Applicant to avoid and minimize impacts to  
74 higher quality undisturbed grasslands. This assessment determined that most  
75 grassland tracts in the Project are dominated by a mix of non-native grasses and  
76 are considered “Average”. Overall, the review of the grassland tracts in the  
77 Study Area reveals a fragmented landscape due to land conversion and  
78 vegetation loss primarily associated with agriculture, but also due to invasive and  
79 noxious species, pesticides, urbanization through road construction, distribution  
80 and transmission lines, pipelines, fiber optic lines, gravel pits, and residential  
81 development. No “Excellent” undisturbed native grasslands were documented in  
82 the Study Area, and only limited, isolated patches of “Above Average” grasslands  
83 (e.g., native species are common but introduced species are also prevalent)  
84 were found, generally limited to the edges of ravines.

85

86 **Q. How does the Project avoid, minimize, or mitigate impacts to vegetation?**

87 A. Project facilities have been sited to minimize impacts to the isolated patches of  
88 “Above Average” grasslands. Only a small amount of the Project’s temporary  
89 impacts (12.1 acres or 1.7 percent) occur in Above Average grasslands.  
90 Similarly, only a small amount (1.3 acres or 1.7 percent) of the Project’s  
91 permanent impacts occur in Above Average grasslands. To further minimize  
92 impacts to grasslands, the Project facilities have generally been sited in areas  
93 where disturbance has previously occurred. Additional minimization measures

94 include utilizing existing roads for access, limiting construction of new roads, and  
95 restoring areas of temporary disturbance to minimize impacts.

96  
97 I understand that the Applicant would restore and regrade disturbed soils after  
98 construction. The construction contractor would coordinate with the Natural  
99 Resources Conservation Service and/or the landowner on seed mixes for  
100 revegetation. The seed mixes and revegetation plan would be developed as part  
101 of the Stormwater Pollution Prevention Plan for the Project.

102  
103 **Q. Discuss the analyses conducted of avian use in the Study Area.**

104 A. To determine the presence, relative abundance, and relative seasonal use of  
105 avian species that occur within the Study Area, the Applicant completed various  
106 surveys in accordance with Tier 3 of the Wind Energy Guidelines (“WEG”), Stage  
107 2 of the Eagle Conservation Plan Guidance (“ECPG”), the federal regulations  
108 regarding eagle permits,<sup>1</sup> and U.S Fish and Wildlife Service (“USFWS”) and  
109 South Dakota Game, Fish and Parks (“SDGFP”) guidance. Avian studies  
110 included raptor nest surveys, eagle/avian use surveys, prairie grouse lek  
111 surveys, and a whooping crane habitat assessment. Eagle/avian use point-count  
112 surveys were completed once monthly from May 2017 to April 2018 during Year  
113 1. The Year 2 surveys are ongoing and will continue through April 2019.

114  
115 **Q. Discuss the analyses conducted of bat use in the Study Area.**

116 A. The Applicant conducted general acoustic bat surveys for 2 years, 2017 and  
117 2018. During 2017, surveys lasted from June 1 to October 15, and during 2018,  
118 surveys lasted from May 7 to October 15. Both years showed similar results, with  
119 an average of 2.93 bat passes per detector night during 2017, and 3.63 bat  
120 passes per detector night during 2018 (Appendix J). These analyses indicated  
121 that bat activity overall is generally low at the Project.

**Q. Are any federally-listed species or state-listed species present within the Study Area?**

A. Three federally listed terrestrial species have the potential to occur in the Study Area: northern long-eared bat (“NLEB”); Rufa red knot; and whooping crane. The whooping crane is also a state-listed endangered species. In addition, bald and golden eagles have the potential to occur in the Study Area. See Section 13.2.1 of the Application for additional discussion.

**Q. Is the Project anticipated to impact federally-listed species or state-listed species?**

A. No. As discussed in Section 13.2.1 of the Application, the NLEB, Rufa red knot, and whooping crane are unlikely to occur within the Project. There are no bald or golden eagle nests within the Study Area. The closest bald eagle nest is approximately 5.5 miles north of the Study Area.

**Q. Based on the analyses you have described, please discuss the anticipated Project impacts on wildlife species.**

A. Wildlife species could be impacted during the construction phase of the Project as a result of habitat disruption and, potentially, direct mortality, although the potential for these impacts is low. The Project, including the gen-tie line, will result in minimal and localized habitat loss, and the Project will follow various best management practices (“BMPs”) to minimize these impacts, as discussed in Section 13.2.2 of the Application. With respect to wildlife impacts, the primary concern associated with wind energy facility construction and operations relates to birds and bats. These species may be directly impacted by the Project. However, the Project has been sited and designed to avoid and minimize impacts to birds and bats. As discussed in Section 13.2.2 of the Application, impacts from the Project are anticipated to be similar to other facilities in the region.

153 **Q. What measures will the Applicant implement to avoid or minimize impacts**  
154 **on wildlife species?**

155 A. As discussed in Section 13.2.2 of the Application, I understand that, as part of  
156 the Project's federal environmental review process, the Project will comply with  
157 applicable mitigation measures specified in the Upper Great Plains Programmatic  
158 Environmental Impact Statement. I also understand that the Applicant is  
159 committed to avoiding and/or minimizing impacts to avian species through  
160 Project design, construction, and operation by implementing measures that  
161 include:

- 162 • Preparing a BBCS in accordance with the USFWS WEG that will be  
163 implemented to minimize impacts to avian and bat species during  
164 construction and operation of the Project;
- 165 • Designing transmission lines and facilities using Avian Power Line  
166 Interaction Committee ("APLIC") guidance to minimize the risk of  
167 electrocution and collision to avian species;
- 168 • Training operations and maintenance staff to recognize eagles and other  
169 sensitive species;
- 170 • Conducting construction monitoring during whooping crane migration  
171 seasons, and stopping construction activities within one mile of observed  
172 whooping cranes until the crane leaves the area;
- 173 • Conducting operational monitoring during whooping crane migration  
174 seasons; operations staff will be trained to identify whooping cranes, and if  
175 any are noted in the Project Area, turbines will be shut down within two  
176 miles of the crane until it leaves the area;
- 177 • Conducting post-construction fatality monitoring for two years to assess  
178 impacts;
- 179 • Siting turbines and other above-ground wind facility infrastructure away  
180 from prairie grouse leks to the extent possible and conducting two years of  
181 post-construction lek monitoring;
- 182 • Avoiding siting turbines and access roads in USFWS Grassland or  
183 Wetland Easements;

- 184 • Avoiding siting turbines in wetlands and waterbodies; and  
185 • Minimizing disturbance to Above Average grasslands.

186  
187 In addition, the Project avoids and/or minimizes impacts to bat species through  
188 its design, construction, and operation by implementing measures that include:

- 189 • Locating the Project in an area with minimal bat habitat (limited wooded  
190 areas in isolated small patches);  
191 • Minimizing siting turbines in wooded patches;  
192 • Minimizing tree removal as much as feasible to reduce impacts to bat  
193 roosting habitat;  
194 • Avoiding tree removal from June 1 through July 31 to reduce potential  
195 impacts to roosts and other tree roosting habitats for bats;  
196 • Feathering blades to manufacturer's cut in speed from sunset to sunrise,  
197 when the temperature is above 50 degrees Fahrenheit, from July 15 to  
198 October 15.

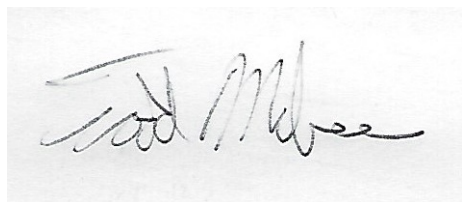

199  
200 **IV. CONCLUSION**

201  
202 **Q. Does this conclude your direct testimony?**

203 A. Yes.

204  
205 Dated this 6th day of March, 2019.
