	)	
	)	

**DIRECT TESTIMONY OF NATHAN WEBER  
ON BEHALF OF  
WEST RIVER COOPERATIVE TELEPHONE COMPANY INC.**

- 1 **Q1. Please state your name, employer, business address and telephone number.**  
2
- 3 A1. My name is Nathan Weber. I am the Director of Engineering of Vantage Point  
4 Solutions, Inc. ("Vantage Point"). My business address is 2211 North Minnesota  
5 Street, Mitchell, South Dakota, 57301.
- 6 **Q2. On whose behalf are you testifying?**  
7
- 8 A2. I am testifying on behalf of West River Cooperative Telephone Company Inc.  
9 ("West River"). Based on my experience working with West River for over 5  
10 years, I know that West River provides local telephone exchange service and  
11 exchange access services in South Dakota and is engaged in the provision of  
12 general telecommunications services in the State of South Dakota subject to the  
13 jurisdiction of the South Dakota Public Utilities Commission ("Commission").

CONFIDENTIAL

1 **Q3. Generally, what types of services does Vantage Point perform?**

2

3 A3. Vantage Point is a telecommunications engineering and consulting company  
4 whose services include long range communication plans and feasibility studies,  
5 emerging technology analysis and migration studies, telecommunications  
6 electronic equipment engineering, outside plant engineering, field services  
7 engineering and regulatory consulting.

8 **Q4. What are your duties and responsibilities at Vantage Point?**

9

10 A4. I am responsible for providing consulting and engineering services to clients in a  
11 wide array of technical and regulatory areas associated with telecommunications.  
12 Our client base consists of small Independent Telephone Companies such as West  
13 River. Vantage Point has more than 80 fulltime employees on staff. I am also  
14 responsible for the normal duties you would expect from the director of  
15 engineering for a company of our size.

16 **Q5. What is your educational background?**

17

18 A5. I have a Bachelor of Science in Electrical Engineering from South Dakota State  
19 University in Brookings, South Dakota.

20 **Q6. Do you hold any professional engineering licenses?**

21 A6. Yes. I am a licensed professional engineer in North Dakota and South Dakota. I  
22 am also a member of the National Council of Examiners for Engineering and  
23 Surveying (NCEES).

24 **Q7. Do you have a resume of your experience?**

25 A7. Yes, it is attached to my testimony as Exhibit NW-D-1.

26

1 **Q8. What is the purpose of your direct testimony?**

2

3 A8. The purpose of my direct testimony is to provide technical facts relating to the  
4 Arbitration<sup>1</sup> between West River and Alltel Communications, Inc. (Alltel). I will  
5 provide information relating to Issue 1 identified in the Petition for Arbitration for  
6 West River (referred to herein as the “Petition”). This issue was presented in the  
7 Petitions as follows: “Is the reciprocal compensation rate for IntraMTA Traffic  
8 proposed by Telco appropriate pursuant to 47 U.S.C. § 252(d)(2)?” Specifically, I  
9 will explain the engineering inputs and how they comply with FCC rule  
10 51.505(b)(1).

11 **Q9. Can you provide a general overview of the engineering inputs provided for**  
12 **the Forward-Looking Economic Cost (FLEC) model?**

13

14 A9. The engineering inputs associated with the West River FLEC model consist of  
15 several components. First, the “Switching” network includes items associated  
16 with the deployment of a typical Class 4/5 voice switch. The individual  
17 components that were included in the FLEC engineering design for the switching  
18 network are separated into four main categories including Common, Line Cards,  
19 Line Interface Cards, and Trunk Cards. The “Inter-Exchange Transport” cost  
20 estimates associated with the West River FLEC study included Inter-Exchange  
21 Transport electronics and Outside Plant (OSP) cable to interconnect the respective  
22 exchanges. The Inter-Exchange Transport cost estimates were divided into three  
23 main categories including Base Costs, Line Costs, and Tributary Costs. Similarly,

---

<sup>1</sup> In The Matter of the Petition Of West River Cooperative Telephone Company Inc. for Arbitration Pursuant to the Telecommunications Act Of 1996 To Resolve Issues Related to The Interconnection Agreement With Alltel, Inc. (referred to herein as the “Petition”).

1 the OSP cable construction cost estimates were separated into “Town” and  
2 “Rural” categories.

3 **Q10. What voice switching technology and architecture was assumed in the**  
4 **development of the FLEC capital investment estimates?**

5  
6 A10. For the purposes of the FLEC engineering model for West River, it was assumed  
7 that they would deploy “Softswitching” technology within their network. The  
8 Softswitching technology is a packet, voice switching technology. This type of  
9 switch will allow for either Time Division Multiplexing (TDM) interfaces or  
10 packet interfaces to be deployed. The Softswitch uses packet technology for  
11 switching voice traffic, but this technology allows for either packet or TDM  
12 circuit connections to be used for line or trunk interfaces.

13 The Softswitch architecture, as commonly implemented in the industry  
14 and in the West River FLEC engineering model, consists of four components  
15 including the Call Agent, Signaling Gateway, Media Gateway, and Outboard Line  
16 Bays (OLB’s). The function of a Call Agent is to provide services such as media  
17 and signaling gateway control and billing, call routing logic, Communications  
18 Assistance for Law Enforcement Act (CALEA) support, and miscellaneous  
19 subscriber services such as call waiting, distinctive ringing, and off-premise  
20 extensions. The Signaling Gateway’s function is to provide the Signaling System  
21 7 (SS7) signaling interface for the Softswitch. In addition, the Media Gateway  
22 provides media (voice) switching and processing capabilities. A diagram  
23 depicting this architecture is attached to my testimony as Exhibit NW-D-2.

24 The OLB equipment is used to provide analog plain old telephone service  
25 (POTS) line interfaces to the end subscribers. In a legacy digital switching

CONFIDENTIAL

1 architecture, the analog POTS lines were typically equipped in separate  
2 equipment bays, and the switch processors communicated with the analog POTS  
3 line cards via inter-bay interfaces and cables. One attribute of Softswitching  
4 platforms that is unique when compared to legacy digital switching architectures  
5 is the absence of on-board analog POTS line cards within the Media Gateway  
6 chassis. For Softswitch deployments, it is typically necessary to use devices such  
7 as OLB terminals, which are sometimes referred to as Digital Loop Carriers  
8 (DLC's), to provide analog POTS line card interfaces to serve the subscribers.  
9 For the West River FLEC engineering design, OLB's were assumed to provide  
10 this functionality. Like other Softswitching networks, the OLB's assumed in the  
11 West River FLEC engineering design function as virtual extensions of the Class 5  
12 switch.

13 For West River, the FLEC engineering design assumed the use of a  
14 distributed Softswitching network. As part of this architecture, centralized Call  
15 Agents are assumed to be deployed at each "host" switching location. The  
16 locations that are designed to include the Call Agents for West River include  
17 Bison and Lemmon.

18 A single Media Gateway with a Signaling Gateway is included for each  
19 exchange. For new switching network deployments, this architecture is  
20 commonly deployed by telecommunications service providers whose number of  
21 subscribers and scope of services offered are comparable to West River.

22 The FLEC engineering design for West River also includes the  
23 deployment of "Intermediate Tandem" functionality at the Bison exchange. In

CONFIDENTIAL

1 this architecture, the trunks from the various West River exchanges are  
2 aggregated in the Bison switch. The purpose of this function is to provide  
3 improved efficiencies by maximizing the “fill” of the outgoing trunks to the  
4 Access Tandem provider. The assumed efficiency of the Intermediate Tandem  
5 function reduces the quantity of trunks to the Access Tandem provider by  
6 approximately 20 percent.

7 **Q11. Can you explain the design parameters were considered when developing the**  
8 **switching network architecture for the FLEC model?**

9  
10 A11. The FLEC engineering design for West River was developed to provide an  
11 efficient voice switching network that offers the appropriate grade of service for  
12 the subscribers of West River. The ability to provide voice services with  
13 99.999% availability is paramount to telecommunications service providers such  
14 as West River. One key attribute that is included in the design is emergency  
15 stand-alone capabilities for all exchanges. This emergency stand-alone  
16 functionality offers the ability for subscribers to make local calls in the event that  
17 the communication path to the Call Agent is severed.

18 In addition, the switching network is designed to adhere to the South  
19 Dakota service standards for telecommunications companies set forth in the  
20 Administrative Rules for South Dakota. Specifically, the switching system was  
21 assumed to include custom calling feature such as call waiting, call forwarding,  
22 abbreviated dialing, caller identification, and three-way calling as set forth in  
23 A.R.S.D. Section 20:10:33:04. Similarly, the switching network is designed to  
24 adhere to A.R.S.D. Section 20:10:33:05 which states that during any busy hour,  
25 the telecommunications service provider network must allow for a minimum of

1 98 percent of call attempts to receive dial tone within three (3) seconds, a  
2 minimum of 98 percent of properly dialed calls for extended service area to be  
3 properly terminated, and a minimum of 98 percent of properly dialed calls routed  
4 entirely over the network of the local exchange carrier to be properly terminated.

5 Other required functions included in the FLEC engineering design for the  
6 switching network include E-911 service support, as well as CALEA support. In  
7 addition, the switching network architecture for the West River FLEC engineering  
8 design included SS7 signaling capabilities.

9 **Q12. In your expert opinion, is the technology and architecture used for the FLEC**  
10 **model considered to be an economical, long-term solution?**

11  
12 A12. Yes. As stated previously, the distributed Softswitching architecture assumed for  
13 the West River FLEC model is a commonly deployed model for new switching  
14 network implementations. One primary reason that this architecture is commonly  
15 deployed in this market space is due to the fact that it is a robust and cost-  
16 effective solution for telecommunications service providers.

17 **Q13. With regards to the engineering design for the “Switching” network for West**  
18 **River, what components comprise the various categories (e.g. Common, Line**  
19 **Cards, Line Interface Cards, and Trunk Cards) for the FLEC capital**  
20 **investment estimates?**

21  
22 A13. The Switching network investments for West River are separated into four (4)  
23 primary categories including “Common”, “Line Cards”, “Line Interface Cards”,  
24 and “Trunk Cards.” First, the category of Common items includes components  
25 that are common to the system. This category of network investment does not  
26 include any voice circuit interface cards that are active in the proposed system.  
27 The items included in the “Common” investment category include, but are not

CONFIDENTIAL

1 limited to, the following: Call Agent hardware, Call Agent software, Media  
2 Gateway chassis (including redundant central processing units, power supplies,  
3 and cooling fans), Media Gateway software, Signaling Gateway hardware, EMS  
4 and Web Provisioning systems, feature right-to-use fees (e.g. CALEA, Centrex,  
5 Web Provisioning, Emergency Stand-Alone, and concurrent call license),  
6 Ethernet interface, OLB chassis, OLB processors, OLB administration interface,  
7 and spare circuit cards. A diagram depicting the allocation of the switching  
8 network components to the respective categories is attached to my testimony as  
9 Exhibit NW-D-3. In addition, a component level pricing breakdown for each  
10 category of investment at each respective exchange is attached to my testimony as  
11 Exhibit NW-D-4.

12 The "Line Cards" category includes only the analog POTS line cards that  
13 are equipped in the OLB chassis. No other equipment is included in this group.

14 Next, the "Line Interface Card" category includes equipment in the Media  
15 Gateway and OLB terminals. The items included are the circuit interface cards  
16 that provide DS-1 GR-303 connectivity between the Media Gateway and the OLB  
17 terminal.

18 Finally, the "Trunk Card" category includes circuit interface cards in the  
19 Media Gateway that are used for trunk interfaces. In other words, these circuit  
20 cards provide communication from the Media Gateway to the Public Switched  
21 Telephone Network (PSTN).

22 A loading factor is included to each investment category for the respective  
23 locations to account for miscellaneous items. Specifically, a 10 percent factor is

1 incorporated in each category to account for installation materials and labor. In  
2 addition, a 15 percent factor is included for miscellaneous costs such as taxes and  
3 engineering.

4  
5 **Q14. What technology and configuration options were assumed for the Inter-**  
6 **Exchange Transport cost estimates?**

7  
8 A14. With regards to the FLEC engineering model designed for the West River Inter-  
9 Exchange Transport network, it is assumed that the network would be  
10 implemented as an OC-192 Synchronous Optical NETWORKING (SONET)  
11 transport network. In accordance with South Dakota Codified Law, Chapter 49-  
12 31-60, the transport network architecture was selected to provide highly available,  
13 switched, survivable optical transport rings between the respective exchanges. In  
14 order to accomplish this, the proposed network is designed in a ring architecture  
15 in which diverse fiber paths are utilized. This is a common network design  
16 architecture that limits the potential for an individual exchange from being  
17 isolated from the rest of the network due to a single fiber optic cable cut. SONET  
18 architectures typically offer rapid traffic recovery in the event of a fiber optic  
19 cable cut or optical transceiver failure. The target failure recovery time for  
20 SONET networks is approximately 50 milliseconds.

21 The proposed SONET infrastructure for West River is assumed to be a  
22 carrier-grade solution that includes redundant power supplies, processor units,  
23 switch fabric, timing units, and cooling fans. In addition, the system is designed  
24 to offer both Synchronous Transport Signal (STS) and Virtual Tributary (VT)  
25 switching capabilities to allow for granular traffic management capabilities. The

CONFIDENTIAL

1 solution included in the FLEC engineering design is required to support a variety  
2 of circuit interfaces such as OC-192, OC-48, OC-12, OC-3, DS-3, DS-1, Gigabit  
3 Ethernet, and 10/100 BaseT. With the exception of the Ethernet interface cards,  
4 the tributary interfaces are configured to provide hardware redundancy to ensure  
5 an appropriate level of availability. Traditional hardware redundancy is typically  
6 not available for Ethernet interfaces today.

7 **Q15. How were the quantities of circuit interface cards assumed for the FLEC**  
8 **capital investment estimates derived?**

9  
10 A15. The quantities of circuit interface cards assumed in the FLEC engineering design  
11 are based upon the circuit requirements for the transport of the Switching network  
12 circuits, as well as miscellaneous special access circuits. The SONET solution  
13 assumed for this FLEC engineering design has circuit interface cards that have  
14 standard densities for interface port quantities. For example, the quantity of DS-1  
15 ports provided on a single DS-1 interface card is 28. Similarly, the DS-3 circuit  
16 interface cards include eight DS-3 interfaces and the 10/100 BaseT Ethernet  
17 circuit interface cards include four 10/100 BaseT interfaces.

18 With regards to the SDN Terminal at the Bison exchange, it is assumed  
19 that the quantity of interfaces equipped at this location will match the equipment  
20 configuration that is presently deployed at this location.

21 **Q16. With regards to the engineering design for the “Inter-Exchange Transport”**  
22 **network for West River, what components comprise the various categories**  
23 **(e.g. Base Cost, Line Interface, Tributary Interface, etc.) for the FLEC**  
24 **capital investment estimates?**

25  
26 A16. The “Inter-Exchange Transport” electronics assumed for the FLEC engineering  
27 design included items that are divided into three (3) primary categories including

CONFIDENTIAL

1           “Base Cost”, “Line Interface”, and “Tributary Interface.” The items included in  
2           the “Base Cost” category are essentially the common hardware and software  
3           elements that are required for the system. Specifically, these items include the  
4           equipment chassis, cooling fan modules, CPU, Digital Communications Channel  
5           (DCC) units, alarm interface units, timing and synchronization modules, STS  
6           switch fabric, VT1.5 switch fabric, system software, Element Management  
7           System software, and miscellaneous cabling. A diagram depicting this  
8           categorization of components is attached to my testimony as Exhibit NW-D-5. In  
9           addition, a component level pricing breakdown for each category of investment at  
10          each respective exchange is attached to my testimony as Exhibit NW-D-6.

11                 The “Line Interface” cost category includes the OC-192 circuit interfaces  
12          cards that are necessary to provide the optical line interfaces between adjacent  
13          SONET network elements.

14                 Finally, the “Tributary Interface” costs include a variety of circuit  
15          interface cards that are required to add and drop traffic at each respective location.  
16          These “Tributary Interface” cards assumed for West River include OC-48, DS-3,  
17          DS-1, Gigabit Ethernet, and 10/100 BaseT Ethernet circuit interface cards.

18                 A loading factor is included to each investment category for the respective  
19          locations to account for miscellaneous items. Specifically, a 10 percent factor is  
20          incorporated in each category to account for installation materials and labor. In  
21          addition, a 15 percent factor is included for miscellaneous costs such as taxes and  
22          engineering.

CONFIDENTIAL

1 **Q17. What methodology was utilized to determine the total route mile distance for**  
2 **Outside Plant (OSP) fiber optic cable construction between the adjacent**  
3 **locations?**

4  
5 A17. In the development of the FLEC engineering design, it was assumed that the fiber  
6 optic transport infrastructure would be implemented to allow for diverse fiber  
7 routes to and from each respective exchange. This design methodology complies  
8 with South Dakota Codified Law, Chapter 49-31-60, by enabling switched  
9 survivable rings. In addition, diverse fiber optic cable routing is commonly  
10 implemented by companies such as West River to prevent a single fiber optic  
11 cable cut from isolating an exchange from the rest of the network. The design of  
12 the fiber optic cable route assumed cable placement that provides for the most  
13 probable and efficient route between adjacent exchanges. It is assumed that  
14 public right-of-way will be used for this fiber optic cable construction. Therefore,  
15 the assumed cable route was designed to follow existing roads. The approximate  
16 distance for the "Town" and "Rural" construction were summed to provide the  
17 total route mile distance between the respective exchanges. A diagram depicting  
18 the general fiber optic cable route is attached to my testimony as Exhibit NW-D-  
19 7.

20 **Q18. What is considered "Town" construction versus "Rural" construction?**

21  
22 A18. For the purposes of this design, it was assumed that the fiber optic cable would be  
23 constructed to the existing central office building in each exchange. Any cable  
24 routes that fall within the city limits of a community, or within an area that has a  
25 population density consistent with a town environment, were designated as  
26 "Town" construction. The routes that fall outside the city limits (or comparable

CONFIDENTIAL

1 population density) are deemed to be “Rural” construction. A diagram depicting  
2 the separation of town and rural construction, as well as the general components  
3 included in each category, is attached to my testimony as Exhibit NW-D-8.

4 **Q19. How was the per-foot rate for the OSP “Town” construction estimates**  
5 **determined?**

6  
7 A19. The OSP “Town” construction per-foot costs were developed by analyzing  
8 deployment costs for actual “Town” construction for communities in South  
9 Dakota. The costs used to develop the per-foot rate were based upon actual OSP  
10 costs for Fiber to the Premises (FTTP) projects in four communities. The  
11 communities whose FTTP construction pricing data was utilized include Brandon,  
12 Garretson, Site C (South Dakota Company that is not part of this litigation), and  
13 Mitchell.

14 The unit tabulations from the construction for these communities were  
15 reviewed, and any units associated with a subscriber drop (connection to a  
16 subscriber location) were removed from the calculation. This was done so that  
17 only “main-line” cable construction was included in the estimates. The subscriber  
18 drop construction costs were removed from the per-foot calculation due to the fact  
19 that it is not representative of the OSP town construction required for Inter-  
20 Exchange transport.

21 The total footage for the four communities was summed, along with the  
22 total construction cost for the fiber optic cable construction in these communities.  
23 The sum of the total construction in these four communities is 1,525,730 feet of  
24 construction at a price of \$18,203,871.57. The resulting total cost was divided by  
25 the total footage to determine the average cost per foot. The outcome was a total

CONFIDENTIAL

1 cost per foot estimate of \$11.93. A loading factor of 15% for engineering and  
2 taxes was added to determine the final result of \$13.72 per foot for OSP town  
3 construction. A detailed pricing breakdown showing the unit quantities and unit  
4 costs used to derive the per-foot pricing estimate for town construction is attached  
5 to my testimony as Exhibit NW-D-9.

6 **Q20. How was the per-mile rate for the OSP "Rural" construction estimates**  
7 **determined?**

8  
9 A20. The OSP Rural construction estimates for West River were based upon actual  
10 rural fiber optic cable construction costs within their service territories. The  
11 pricing of \$962,406.43 is the construction cost for a 118 mile OSP project that  
12 was bid for West River in July 2006. An annual "normalization" factor of 5%  
13 was added to the OSP bid price to determine the estimated current pricing for  
14 rural construction. The result of this normalization is an estimated cost for  
15 construction of \$1,010,526.75 for an equivalent project being bid in December  
16 2007. Dividing this normalized total by 118 routes miles provides an average cost  
17 per mile of approximately \$8,560 in the West River service territories. This result  
18 was subsequently multiplied by a 15% loading factor to account for items such as  
19 engineering and taxes. The final, loaded cost per mile for rural OSP construction  
20 is estimated at approximately \$9,844. A detailed pricing breakdown showing the  
21 unit quantities and unit costs used to derive the per-foot pricing estimate for town  
22 construction is attached to my testimony as Exhibit NW-D-10.

23 **Q21. Does that conclude your testimony?**

24 A21. Yes. However, I wish to reserve the opportunity to supplement this testimony in  
25 the future, if necessary.

**REBUTTAL TESTIMONY OF NATHAN A. WEBER  
ON BEHALF OF  
ALLIANCE COMMUNICATIONS COOPERATIVE, INC.,  
MCCOOK COOPERATIVE TELEPHONE COMPANY,  
BERESFORD MUNICIPAL TELEPHONE COMPANY,  
KENNEBEC TELEPHONE COMPANY, INC.,  
SANTEL COMMUNICATIONS COOPERATIVE, INC.,  
AND  
WEST RIVER COOPERATIVE TELEPHONE COMPANY INC.**

- 1 **Q1. Please state your name, employer, business address and telephone number.**
- 2
- 3 A1. My name is Nathan Weber. I am the Director of Engineering of Vantage Point
- 4 Solutions, Inc. ("Vantage Point"). My business address is 2211 North Minnesota
- 5 Street, Mitchell, South Dakota, 57301.
- 6 **Q2. On whose behalf are you testifying?**
- 7
- 8 A2. I am testifying on behalf of Alliance Communications Cooperative, Inc.
- 9 ("Alliance"), McCook Cooperative Telephone Company ("McCook"), Beresford
- 10 Municipal Telephone Company ("Beresford"), Kennebec Telephone Company

CONFIDENTIAL

1 (“Kennebec”), Santel Communications Cooperative, Inc. (“Santel”), and West  
2 River Cooperative Telephone Company Inc. (“West River”). I will refer to them  
3 collectively as the Rural Telephone Companies (RTC’s).

4 **Q3. Have you previously filed testimony in this case?**

5

6 A3. Yes. On March 24, 2008, I filed direct testimony on behalf of each of the six  
7 companies (Alliance, McCook, Beresford, Kennebec, Santel, and West River) in  
8 dockets TC07-111 through TC07-116.

9 **Q4. What is the purpose of your rebuttal testimony?**

10

11 A4. To respond to technical and regulatory issues that rose in the direct testimony and  
12 supplemental direct testimony of W. Craig Conwell on behalf of Alltel  
13 Communications, LLC. (“Alltel”) in these proceedings.

14 **Q5. Have you read the pre-filed direct testimony and supplemental direct**  
15 **testimony of Mr. Conwell in these proceedings?**

16

17 A5. Yes.

18 **Q6. Mr. Conwell states, “[RLECs] have failed to produce documentation that**  
19 **would satisfy the requirements of FCC Rule §51.505(e)”. He lists the**  
20 **example of the cost studies assuming similar configurations of equipment for**  
21 **switches and transport electronics (between host and “non-host switches”)**  
22 **and not showing the alternative, lower cost configurations that might be used**  
23 **and therefore have not proven that the “efficient network configuration”**  
24 **requirement of §51.505(b)(1) has been met<sup>1</sup>.” Do you agree with Mr.**  
25 **Conwell’s statement? Please explain.**

---

<sup>1</sup> Mr. Conwell’s Supplemental Direct Testimony, Page 5 Lines 1-17.

CONFIDENTIAL

1 A6. No. The switching and transport networks assumed for the FLEC engineering  
2 model utilized commonly deployed network architectures for the respective  
3 companies and networks. In addition, the proposed network plan is a forward  
4 looking architecture that is intended to be adequate for the typical life cycle of the  
5 transport and switching electronics. Specifically, it is my experience that  
6 transport electronics have a useful life of 7 to 10 years, while switching  
7 electronics are typically utilized for 10 to 12 years. Future network replacements  
8 or additions prior to the end of the useful life of the equipment caused by under-  
9 engineering the system actually cause the solution to be less efficient. Ultimately,  
10 the network replacements or enhancements required prior to the end of the useful  
11 life of the electronics have the effect of increasing the total long-run cost of the  
12 network.

13 As will be subsequently stated in my rebuttal testimony, multiple options  
14 were considered for the switching network configuration. Ultimately, these  
15 options were evaluated and the most efficient solution was utilized for the FLEC  
16 engineering model.

17 **Q7. Mr. Conwell states, "Nor is there any evidence that the RLEC proposed**  
18 **packet switching network represents a more efficient configuration."**<sup>2</sup> **Do**  
19 **you agree with this statement? Please explain.**

20 A7. Absolutely not. Mr. Conwell seems to imply in his statement that legacy digital  
21 electronic switching platforms such as the Nortel Networks Inc. ("Nortel")  
22 DMS-10 may represent a more efficient switching configuration than the packet

---

<sup>2</sup> Mr. Conwell's Direct Testimony, Page 21 Lines 2-3.

CONFIDENTIAL

1 switching architecture that was utilized in the development of the FLEC model.  
2 There are several reasons why the new "Next Generation" packet-based switching  
3 platforms are more efficient than legacy digital electronic switching systems.  
4 First and foremost, the typical status of the legacy digital electronic switching  
5 systems that are marketed to RTC's is that these products have either been  
6 "capped" or Manufacture Discontinued (MD'd). For example, the Nortel DMS-  
7 10 switching architecture has been capped. In other words, Nortel is no longer  
8 developing new hardware or software features for this system. In addition, Nortel  
9 has announced the MD of all of their DMS remote switches with the exception of  
10 the RLCM. Other companies who market Class 5 switches to RTC's such as the  
11 Siemens EWSD and the Stromberg-Carlson (now owned by GenBand) DCO have  
12 also announced the MD of all or portions of the respective platforms. This  
13 distinct trend in the industry shows that legacy digital electronic switching  
14 systems are at the end of their lifecycle. It would be extremely inefficient to  
15 implement a switching network architecture today and then have to make a  
16 significant investment in a replacement switch within a matter of only a few  
17 years.

18 Secondly, legacy digital switches typically have separate equipment bays,  
19 shelves, and/or circuit cards for each service type (e.g. toll trunks, GR-303, ISDN,  
20 etc.) With the advent of packet switching technologies, multiple services types  
21 are supported on a single circuit interface card. In many cases, the packet  
22 switching systems can offer toll, GR-303, and ISDN on the same card, and the  
23 network operator can software-select the service type on a port-by-port basis.

CONFIDENTIAL

1           Because of this fact, the investment required for a packet switching platform is  
2           often less than a legacy platform by having fewer components to purchase and  
3           spare.

4   **Q8. Mr. Conwell states, “in the cases of Santel and West River, Alltel meet points**  
5   **with Qwest, which I understand is the transit provider for mobile-to-land**  
6   **traffic, are at switches other than Woonsocket and Bison. This means that**  
7   **the incremental tandem switch investments for these RLECs are likely not**  
8   **direct costs of termination. If so, the tandem switch portion of the**  
9   **investments should be removed.”<sup>3</sup> Do you agree with this statement? Please**  
10   **explain.**

11   **A8.** I do not agree with Mr. Conwell’s assessment of the tandem switching  
12    functionality. The purpose of providing the intermediate tandem switching  
13    capabilities for the respective sites such as Brandon, Woonsocket, and Bison is to  
14    provide improved efficiencies for the network. Specifically, the intermediate  
15    tandem function provides economies of scale to allow for better fill (utilization) of  
16    outgoing trunks to other connecting carriers, and this functionality is assumed to  
17    provide a 20 percent reduction in the quantity of trunks that are required to be  
18    interfaced to other carriers. It can therefore be concluded that the intermediate  
19    tandem functionality provides approximately a 20 percent reduction in the cost for  
20    the RTC’s to transport the traffic to their access tandem provider and other  
21    interconnected carriers.

---

<sup>3</sup> Mr. Conwell’s Direct Testimony, Page 27 Lines 16-21.

CONFIDENTIAL

1           Mr. Conwell implies in his testimony that the cost associated with the  
2 tandem switching functionality for these switches may be greater than other hosts  
3 of comparable size. This is an inaccurate statement. The cost for providing the  
4 intermediate tandem switching functionality for these sites is extremely low. In  
5 fact, the Woonsocket intermediate tandem switch has the highest incremental cost  
6 on a percentage basis for providing this functionality. The total incremental cost  
7 for the intermediate tandem function is approximately 0.87 percent of the total  
8 estimated switch investment for Santel.

9           Mr. Conwell also made incorrect statements regarding the meet point  
10 locations with Santel and West River. In his testimony, Mr. Conwell indicated  
11 that "...in the cases of Santel and West River, Alltel meet points with Qwest,  
12 which I understand is the transit provider for mobile-to-land traffic, are at  
13 switches other than Woonsocket and Bison." First, I assume that Mr. Conwell  
14 was referring to the RTC meet point with Qwest, and not the Alltel meet point.  
15 The portion in which Mr. Conwell states that the meet points with Qwest are at  
16 "switches" other than Woonsocket and Bison is technically incorrect. Qwest has  
17 transport facility meet points with Santel at Mitchell and with West River at  
18 Maurine. However, there is no RTC switch at either of these locations. In fact,  
19 both Mitchell and Maurine are outside the RTC service territories for Santel and  
20 West River respectively.

CONFIDENTIAL

1 **Q9. Please address Mr. Conwell's statement that, "Kennebec should show that**  
2 **there are no technically feasible alternatives but to spend \$346,200 for**  
3 **common equipment, line interfaces and line cards for a switch with 334 lines**  
4 **in service."**<sup>4</sup>

5 A9. During the course of developing the Kennebec switching architecture estimates,  
6 several architectural options were examined. One of the requirements set forth  
7 for each option was that it needed to provide a sufficient Grade of Service (GoS),  
8 including Emergency Stand-Alone (ESA) functionality for each site. The specific  
9 options that were examined include the following:

- 10 • MetaSwitch Distributed Media Gateway
- 11 • MetaSwitch Integrated Softswitch
- 12 • Nortel CS-1500

13 These options represent the most commonly deployed switches in the RTC  
14 market today. Rather than inappropriately focusing on one specific exchange, we  
15 evaluated the total cost for the proposed switching network for Kennebec  
16 Telephone Company. The results showed that the MetaSwitch Distributed Media  
17 Gateway option that was included in the FLEC engineering model was the lowest  
18 cost solution. The MetaSwitch Integrated Softswitch was approximately 6  
19 percent more expensive than the MetaSwitch Distributed Media Gateway option  
20 that was used in the FLEC study, while the Nortel CS-1500 option was more than  
21 30 percent more expensive. Therefore, it was concluded that the MetaSwitch

---

<sup>4</sup> Mr. Conwell's Direct Testimony, Page 29 Lines 8-11.

CONFIDENTIAL

1 Distributed Media Gateway option that was included in the FLEC engineering  
2 model is an efficient solution.

3 **Q10. Can you please answer Mr. Conwell's question of "Are all components of**  
4 **switch investment indeed for switching equipment, as opposed to DLC**  
5 **systems, interoffice transport systems or other?"**<sup>5</sup>

6 A10. Yes. In answer to Mr. Conwell's question, all components of the switch  
7 investment are for equipment that is consistent with the switching function. No  
8 investments have been included that are associated with interoffice transport  
9 functions. Outboard Line Bays (OLB's) were included in the switching network  
10 investment estimates due to the fact that they function as virtual extensions of the  
11 switch.

12 **Q11. Can you please answer Mr. Conwell's question of "Do switch investments**  
13 **include investment for tandem switching?"**<sup>6</sup>

14 A11. Yes. As stated previously, there are investments included in the switching  
15 network cost estimates for the intermediate tandem switching functionality at the  
16 locations such as Brandon, Woonsocket, and Bison. The cost to provide this  
17 functionality is very minimal and is more than offset by the network efficiencies  
18 achieved.

19

---

<sup>5</sup> Mr. Conwell's Direct Testimony, Page 30 Lines 7-8.

<sup>6</sup> Mr. Conwell's Direct Testimony, Page 30 Line 12.

1 **Q12. Can you please answer Mr. Conwell's question of "Are the quantities of**  
2 **equipment items included in switch investments sized as efficiently as**  
3 **possible based on expected demand and the capabilities of equipment?"**<sup>7</sup>

4 A12. Yes. In answer to Mr. Conwell's question, the quantities of equipment items  
5 included in the switch investments are sized as efficiently as possible. As with  
6 many other technologies, the manufacturers of switching electronics components  
7 have determined that it is more economical for them to develop and manufacture  
8 components that accommodate a wide range of companies and exchanges. This is  
9 common practice due to the fact that economic analyses have shown it is less  
10 expensive for the switch vendor to design, manufacture, stock, and support fewer  
11 items. The system was designed to be efficient based on the equipment presently  
12 available from commonly deployed switching vendors that serve the RTC  
13 marketplace.

14 **Q13. Can you please answer Mr. Conwell's question of "Are equipment unit costs**  
15 **or material prices from valid sources and representative of the current costs**  
16 **to purchase and install switching equipment?"**<sup>8</sup>

17 A13. Yes. In answer to Mr. Conwell's question, the equipment costs utilized for the  
18 FLEC model are based upon a composite of proposals received from switching  
19 electronics vendors for entities other than Alliance, Beresford, Kennebec,  
20 McCook, Santel, and West River. The pricing utilized is specific to projects of

---

<sup>7</sup> Mr. Conwell's Direct Testimony, Page 30 Lines 17-19.

<sup>8</sup> Mr. Conwell's Direct Testimony, Page 30 Lines 20-22.

CONFIDENTIAL

1 similar size and scope to the respective RTC networks. For all companies, the  
2 pricing was based on a commonly deployed switching platform and configuration.

3 **Q14. Can you please answer Mr. Conwell's question of "Are there alternative  
4 technologies or network configurations that would be more efficient,  
5 particularly for small host and "non-host switches?"**<sup>9</sup>

6 A14. Yes. During the process of developing the FLEC engineering model, we  
7 examined several potential architectures for the switching networks. Each of the  
8 solutions evaluated were able to provide the requisite GoS that were included in  
9 the design requirements. As with Kennebec, the results of the evaluation  
10 consistently showed that the MetaSwitch Distributed Media Gateway architecture  
11 was an efficient solution for the respective companies.

12 **Q15. Can you please answer Mr. Conwell's question of "are the 'non-host  
13 switches' actually switches according to the FCC definition of termination, as  
14 opposed to DLC terminals, remote loop concentrators, etc.?"**<sup>10</sup>

15 A15. Yes. The "non-host" switches are actually switches and not DLC terminals. The  
16 architecture utilized for the FLEC engineering model was a packet switching  
17 model with Media Gateways at all exchanges and centralized Call Agents. The  
18 Media Gateways have ESA functionality, as well as trunking capabilities.

19

---

<sup>9</sup> Mr. Conwell's Direct Testimony, Page 31 Lines 1-2.

<sup>10</sup> Mr. Conwell's Direct Testimony, Page 31 Lines 3-5.

CONFIDENTIAL

1 **Q16. Mr. Conwell states, “RLECs had not produced information giving details on**  
2 **the equipment items, capacities, quantities and unit investments underlying**  
3 **the total investments for each exchange and category. Therefore, it was not**  
4 **possible to fully evaluate the investments for compliance with FCC Rule**  
5 **§51.505(b and §51.505(b)(1) (the definition of TELRIC and the efficient**  
6 **network configuration requirement)<sup>11</sup>.” Do you agree with Mr. Conwell’s**  
7 **statement? Please explain.**

8 A16. No, I do not agree with Mr. Conwell. Sufficient information was provided with  
9 the supplemental discovery response to show the software components and  
10 equipment quantities that were included in the switching network cost estimates  
11 for each exchange. The RTC’s have provided a detailed equipment list that  
12 provides a description of each component, a quantity of each component, and a  
13 categorical total for the base cost, trunk interface, line interface, and line cards.  
14 This level of information provides more than adequate detail to enable Alltel to  
15 test the design.  
16

---

<sup>11</sup> Mr. Conwell’s Supplemental Direct Testimony, Page 6 Lines 10-15.

CONFIDENTIAL

1 **Q17. Mr. Conwell states in regard to the spreadsheet labeled “CO Switch Detailed**  
2 **Estimates” provided by the RLECS that, “The spreadsheet identifies**  
3 **hardware and software components included and the quantities of each. But,**  
4 **it does not provide component capacities (if applicable) and unit**  
5 **investments.”<sup>12</sup> Do you agree with Mr. Conwell’s statement? Please explain.**

6 A17. Mr. Conwell’s statement regarding the component capacities not being provided  
7 is inaccurate. The descriptions for each circuit interface card provide very  
8 specific information regarding the quantity of interface ports on each circuit card.  
9 In addition, details were provided to Alltel in the initial discovery responses  
10 regarding the maximum number of concurrent calls that could be provided from a  
11 “host” or “non-host” location. The combination of this information sufficiently  
12 provides the component capacities of the proposed packet switching systems.

13 **Q18. Mr. Conwell states that “The RLECs continue to not provide specific details**  
14 **regarding the sources of the unit investments.” And adds that “RLECs have**  
15 **failed thus far to prove that the unit investments underlying total switch**  
16 **investments in their cost studies are representative of the current costs the**  
17 **RLECs would incur to purchase and install new switches.”<sup>13</sup> Do you agree**  
18 **with Mr. Conwell’s statement? Please explain.**

19 A18. No, I do not agree with Mr. Conwell. A significant amount of information has  
20 been provided to Alltel with regards to the switching network investment detail.  
21 Alltel has received detailed descriptions of the individual components that

---

<sup>12</sup> Mr. Conwell’s Supplemental Direct Testimony, Page 7 Lines 15-17.

<sup>13</sup> Mr. Conwell’s Supplemental Direct Testimony, Page 8 Lines 9-10 and Lines 22-25.

CONFIDENTIAL

1           comprise the estimates, as well as quantities of these components. This amount of  
2           information is adequate to allow Alltel to test the design and cost estimates for the  
3           proposed system.

4   **Q19. Do you agree with Mr. Conwell when he states “MetaSwitch also offers an**  
5           **‘integrated softswitch option’ that might satisfy RLEC requirements and**  
6           **provide a more “efficient network configuration” per §51.505(b)(1)”<sup>14</sup>?**  
7           **Please explain.**

8   A19. No, I do not agree with Mr. Conwell. To clarify, MetaSwitch does offer an  
9           integrated softswitch option in which the Call Agent functionality is implemented  
10          in each switch (Media Gateway) rather than being centralized. However, when  
11          we examined this alternative configuration, it was determined that the integrated  
12          softswitch option was more expensive and less efficient than the distributed media  
13          gateway architecture that was utilized. This cost increase is caused by several  
14          factors. First, investment in Call Agent functionality is required at all locations  
15          for the integrated softswitch option rather than at select, centralized locations. In  
16          addition, the integrated softswitch option may require additional investment in  
17          Element Management System hardware and software. This is due to the fact that  
18          call agents must be provisioned and managed at every location rather than at  
19          centralized locations. In fact, we found that the integrated softswitch option  
20          would be approximately 22.3 percent more expensive than the distributed media  
21          gateway architecture for Santel and 18.9 percent more expensive for West River.

---

<sup>14</sup> Mr. Conwell’s Supplemental Direct Testimony, Page 9 Lines 21-22 and Page 10 Line 1.

CONFIDENTIAL

1 **Q20. Do you agree with Mr. Conwell's statement where he indicated "A pair of**  
2 **CAs is deployed in each exchange, or at each host and 'non host switch'"<sup>15</sup>.**

3 A20. No, Mr. Conwell is mistaken. As stated in my direct testimony, the FLEC  
4 engineering design assumed the use of a distributed softswitch architecture. In  
5 other words, Media Gateways were equipped in each exchange, but the Call  
6 Agents that facilitate the call contract were centralized in one or two sites per  
7 company. Specifically, the Call Agents were only equipped at the "host"  
8 switching locations. The distributed softswitch architecture was chosen to reduce  
9 cost and increase the efficiency of the network. The integrated softswitch  
10 architecture that Mr. Conwell suggested may be more efficient requires Call  
11 Agent functionality to be equipped at all exchanges. As stated previously, the  
12 integrated softswitch architecture is more expensive, and less efficient from a  
13 network management perspective, than the distributed softswitch architecture that  
14 was assumed for the FLEC engineering model.

15 **Q21. Do you agree with Mr. Conwell when he states "it appears that little, if any,**  
16 **of the investment and associated annual costs included in the switch *common***  
17 **category are usage-sensitive or attributable to terminating mobile-to-land**  
18 **traffic"<sup>16</sup>? Please explain.**

19 A21. No, I do not agree with Mr. Conwell. Telephone switch engineering technical  
20 documents often make reference to traffic sensitive design and engineering. In  
21 fact, Mr. Conwell referred to some of the traffic sensitive design parameters in his

---

<sup>15</sup> Mr. Conwell's Supplemental Direct Testimony, Page 9 Lines 13-15.

<sup>16</sup> Mr. Conwell's Supplemental Direct Testimony, Page 12 Lines 13-15.

CONFIDENTIAL

1 direct testimony when he referred to the Busy Hour Call Attempt (BHCA) values  
2 that were provided on the MetaSwitch website. With telephone switching  
3 systems, multiple portions of the system, including the switching fabric, are  
4 engineered to a particular GoS. The traffic sensitive components are typically  
5 engineered and provisioned based on a particular GoS expressed in either Erlangs  
6 or Centum Call Seconds (“CCS”).

7 **Q22. Are there portions of the switching network that are not traffic sensitive?**

8 A22. Yes. The non-traffic sensitive portions of a wireline switching network are the  
9 physical subscriber line termination interface (Line Card) and the physical  
10 subscriber local loop (typically copper cable) that connects the physical line  
11 termination to the subscriber. The physical trunk termination interface (often  
12 referred to as a Trunk Card) is traffic sensitive since the quantity of the physical  
13 trunk interfaces required is driven by the traffic in the system. Let me discuss  
14 each of these elements in detail.

15 The physical subscriber line termination is often referred to as a “line  
16 card” in the switching jargon. This physical line termination has a one-to-one  
17 relationship with the quantity of lines in the serving area. Simply put, for every  
18 subscriber line in the serving area, the RTC must provide one line card  
19 termination. No traffic engineering is required for the line card.

20 The physical subscriber local loop is defined as the physical facility that  
21 connects the subscriber premise to the Line Card Termination. This connection  
22 can be either fiber or copper (depending upon the design of the network  
23 distribution architecture). Regardless of the facility used, the “local loop” is

CONFIDENTIAL

1           designed the same whether the subscriber uses the facility for one minute a day or  
2           1,440 minutes (24 hours) a day. Clearly, the physical subscriber local loop that  
3           connects the subscriber premise to the Line Card is not traffic sensitive.

4   **Q23. Is everything in the switch traffic engineered, and thus traffic sensitive,**  
5           **except for the line card?**

6   A23. Yes. However, with the advances in processing technology, the switching  
7           manufacturers have pre-engineered some of the switching components to  
8           accommodate a wide range of traffic levels. As stated previously, financial  
9           analysis has shown that it is typically less expensive for switching vendor to  
10          design, manufacture, stock, and support fewer items. One of the most prominent  
11          pre-traffic engineered components is the switching processor. Most switching  
12          manufacturers offer very little choice in the selection of processor capacities. It is  
13          a business decision for the switching vendors to select a processor design that will  
14          cover the target traffic levels of their market. In fact, over the life of a particular  
15          switching product line, the industry changes and growth in traffic has necessitated  
16          processor upgrades to accommodate the added switching requirements. I do not  
17          draw a distinction between items that are traffic engineered by the switching  
18          manufacturer during the design phase and items that are traffic engineered during  
19          the procurement phase. The final conclusion is that all of the components with  
20          the exception of the Line Card in a switching system are traffic engineered and  
21          are traffic sensitive.

1 **Q24. Do you agree with Mr. Conwell in regards to Call Agent when he states “CA**  
2 **investments and costs are not usage-sensitive and recoverable in termination**  
3 **charges”<sup>17</sup>? Please explain.**

4 A24. Absolutely not. In Mr. Conwell’s testimony, he specifically references the  
5 MetaSwitch website and indicates that the CA9024 Call Agent Server has design  
6 parameters that include the quantity of Busy Hour Call Attempts (BHCA). This  
7 parameter which specifically addresses the limit with regards to the number of  
8 call attempts that can be successfully handled by the Call Agent over a given  
9 period of this is, by nature, a usage sensitive parameter. In addition, MetaSwitch  
10 charges Concurrent Call Licenses for the Call Agents. This fact indicates that the  
11 Call Agent is usage sensitive, and the costs increase incrementally with increased  
12 usage of the component.

13 Mr. Conwell’s argument centers on the assertion that since the RTC’s  
14 usage will not exhaust the capacity of the Call Agent, the Call Agent is not usage  
15 sensitive. Essentially, Mr. Conwell is implying that if there were two Call Agent  
16 options available that each have respective limitations for traffic sensitive  
17 parameters such as BHCA, the only Call Agent that can be classified as traffic  
18 sensitive is the one than may be exhausted by potential use of the component.  
19 This argument is extremely flawed. It would be analogous to stating that a four-  
20 lane portion of Interstate 90 through Sioux Falls is traffic sensitive due to the fact  
21 that there is sufficient population to exhaust the capacity, but the four-lane portion  
22 of Interstate 90 that passed by Kennebec is not traffic sensitive.

---

<sup>17</sup> Mr. Conwell’s Supplemental Direct Testimony, Page 9 Lines 20-21.

CONFIDENTIAL

1           MetaSwitch makes a single external Call Agent that is sized for a wide  
2           variety of companies and application because they have determined it to be more  
3           economical to develop, manufacture, stock, and support a single device.  
4           Therefore, the smallest, and most economical, Call Agent from MetaSwitch was  
5           utilized in this design.

6   **Q25. Do you agree with Mr. Conwell in regards to 3510 Media Gateway (MG)**  
7   **Chassis and MG software when he states “their investments and costs are not**  
8   **usage-sensitive and recoverable in termination charges. This also applies to**  
9   **the associated MG software”<sup>18</sup>? Please explain.**

10   A25. No. As stated previously, switching manufacturers typically pre-engineer the  
11       switching components to accommodate a wide range of traffic levels. However,  
12       the components of the switching network, with the exception of the line cards, are  
13       traffic engineered and are traffic sensitive. With regards to the Media Gateway, it  
14       does not contain line cards; therefore, it can be concluded that all components of  
15       the Media Gateway are traffic sensitive. Once again, Mr. Conwell’s assertion that  
16       the Media Gateway is not traffic sensitive because the RTC’s traffic will not  
17       exhaust the capabilities is fundamentally flawed.

18

---

<sup>18</sup> Mr. Conwell’s Supplemental Direct Testimony, Page 10 Lines 13-15.

1 **Q26. Do you agree with Mr. Conwell in regards to Outboard Line Bay when he**  
2 **states “OLB chassis and processor appear to be terminals for broadband**  
3 **loop carriers, similar to digital loop carrier systems. They are part of access**  
4 **or loop plant and should be excluded from termination, just as a digital loop**  
5 **carrier system would not be included in termination provided in a traditional**  
6 **TDM switch architecture”<sup>19</sup>? Please explain.**

7 A26. No. As stated in my direct testimony, the switching architecture included  
8 investments for Outboard Line Bay (OLB) terminals. The OLB’s serve as virtual  
9 extensions of the switching platform by providing plain old telephone service  
10 (POTS) interfaces for customers. In addition, the FLEC engineering model  
11 assumed that the OLB’s would connect to the packet switching platform via  
12 GR303 based DS-1 connections. These connections are traffic engineering based  
13 on the desired concentration ratio and GoS offered to subscribers. The FLEC  
14 model assumed a concentration ratio of 4:1 for the ratio of analog POTS  
15 interfaces to DS-0 equivalents for the GR-303 DS-1 interfaces. This is a typical  
16 concentration ratio for an RTC with mostly residential subscribers. This ratio can  
17 change based on the changing mix of traffic over time. For example, if factors  
18 such as additional call volumes or longer hold times occur, it may be necessary to  
19 reduce the concentration ratio to 2:1. This would require additional GR303 based  
20 DS-1’s to be equipped in both the packet switch and the OLB. Therefore, the  
21 OLB equipment, with the exception of the analog line cards, can be considered  
22 traffic sensitive and is appropriate to categorize with the switching electronics.

---

<sup>19</sup> Mr. Conwell’s Supplemental Direct Testimony, Page 11 Lines 21-24 and Page 12 Lines 1-2.

1 **Q27. Do you agree with Mr. Conwell when he states “Since the RLECs have not**  
2 **produced unit investments for each component, it is not possible to determine**  
3 **the significance of spare costs. Nevertheless, given that many switches likely**  
4 **are in unmanned locations requiring a technician to be dispatched for**  
5 **physical repairs, a more efficient network configuration might result from**  
6 **centralizing spares and reducing their quantity and costs”<sup>20</sup>? Please explain.**

7 A27. I do not agree with Mr. Conwell. The RTC’s have provided sufficient data for  
8 Alltel to test the design and cost estimates provided with the FLEC engineering  
9 model. As part of this, the level of detail provided to Alltel is sufficient for them  
10 to make a determination as to the approximate cost of spares, as well as the  
11 relative cost in relation to the entire switching network. Regardless, the packet  
12 switching network architecture assumed for the FLEC model has more efficient  
13 sparing arrangements than legacy digital switching architectures. The legacy  
14 architectures, by nature, have a wide variety of circuit interface cards that need to  
15 be spared, enough to literally fill one or more storage cabinets. In comparison,  
16 the packet switching architectures require very few spares, and the cost of these  
17 spares is smaller, as well.

18 It is the goal of our clients to expedite the correction of any service  
19 affecting event on the network. In many cases, the RTC’s serve very large  
20 geographical territories. In the case of West River, the driving distance between  
21 Bison and Nisland is over 100 miles. If an outage occurred in this network due to  
22 a failed circuit card, it may take up to two hours to retrieve a spare from Bison,

---

<sup>20</sup> Mr. Conwell’s Supplemental Direct Testimony, Page 12 Lines 5-10.

CONFIDENTIAL

1 drive the equipment to Nisland, and replace the failed circuit card. The duration  
2 of service outage induced by centralizing spares does not adhere to the GoS  
3 required of these RTC's.

4 Service providers that cover large geographic territories often will utilize  
5 "area" technicians to serve their subscribers better. These are technicians who are  
6 located in or near the outlying exchanges. If spares are distributed to each  
7 exchange, the service outage time due to hardware issues can be greatly reduced.  
8 This is especially true for larger, less populated service territories.

9 **Q28. Do you agree with Mr. Conwell when he states "one factor contributing to**  
10 **high investments per line for small exchanges is that media gateways and**  
11 **related components are assumed to be placed in all exchanges regardless of**  
12 **line size"**<sup>21</sup>? **Please explain.**

13 **A28.** I agree with the statement that Media Gateways and the associated components  
14 were assumed for each exchange. This is necessary in the packet switching  
15 architecture for providing the appropriate GoS for the RTC's. Specifically, the  
16 target that these networks were designed to achieve is 99.999% availability. The  
17 Media Gateways allow for functionality such as ESA in each exchange. This is  
18 considered a critical requirement that allows the consumers to make local calls,  
19 including local emergency calls, in the event that the communication path to the  
20 Call Agent is severed.

21 However, it should be noted that this packet switching design with  
22 centralized Call Agents and distributed Media Gateways is an efficient

---

<sup>21</sup> Mr. Conwell's Supplemental Direct Testimony, Page 13 Lines 7-10.

CONFIDENTIAL

1 architecture for the RTC's. This is a commonly deployed architecture for many  
2 rural service providers due to the fact that the design is very efficient. The  
3 primary cause for the "high investment per line" that Mr. Conwell references is  
4 the fact that these RTC's serve rural areas. They do not have the subscriber base  
5 that provides the economies of scale that can be achieved in major metropolitan  
6 markets such as Seattle, Washington.

7 **Q29. Do you agree with Mr. Conwell when he states "For host switches (excluding**  
8 **two switches serving as intermediate tandems), utilization of the T3 trunk**  
9 **card ranges from only four to 15 percent. This low utilization results in high**  
10 **trunk card investments per line in the smaller host switches"<sup>22</sup>? Please**  
11 **explain.**

12 A29. No, I do not. Mr. Conwell's calculations do not appear to be accurate. The 3-port  
13 T3 modules assumed for the host switching sites can support up to 2,016 DS-0's.  
14 The number of DS-0 trunks included in the FLEC engineering model for the host  
15 switching (excluding intermediate tandem sites) ranges from 240 to 480.  
16 Summing the DS-0 trunks and line interfaces for these sites increases the total to  
17 552 DS-0's and 744 DS-0's respectively. This represents a utilization of 27.4  
18 percent to 36.9 percent for the sites.

19 When developing the engineering design for the FLEC models, the  
20 switching network was evaluated to determine the most efficient solution on a  
21 companywide basis. Mr. Conwell is attempting to evaluate on a per-circuit card  
22 or per-service basis. In general, this is a flawed method of evaluating the

---

<sup>22</sup> Mr. Conwell's Supplemental Direct Testimony, Page 14 Lines 8-11.

CONFIDENTIAL

1 switching system. Evaluating the switching network and finding the most  
2 efficient solution on a system-wide basis is the appropriate and most equitable  
3 solution for all parties.

4 **Q30. Please address Mr. Conwell's statement that "It is important that the RLECs  
5 demonstrate that alternative trunk cards with less capacity and lower costs  
6 are not available."<sup>23</sup>.**

7 A30. The FLEC engineering model for the switching network architecture included a  
8 distributed softswitch model. Many engineering parameters were evaluated in  
9 selecting this architecture. As stated previously, the switching network was  
10 evaluated on a companywide basis and not a component level basis. Ultimately,  
11 the distributed model called for MG3510 chassis to be utilized at "host" switching  
12 locations and MG2510 chassis to be used at "non-host" locations. The trunk  
13 cards used at the respective sites are the lowest port density and lowest cost cards  
14 available for that particular system. This design represents the most efficient  
15 architecture that was evaluated, while providing an adequate GoS.

16 **Q31. In his testimony, Mr. Conwell states "The CALEA and Centrex license fees  
17 should not be included in termination, since these costs are not attributable  
18 to terminating mobile-to-land traffic"<sup>24</sup>. Why were these investments  
19 included in the switching network cost estimates?**

20 A31. The CALEA and Centrex licenses are standard components that are included in  
21 virtually every softswitch that has been implemented by Vantage Point.

---

<sup>23</sup> Mr. Conwell's Supplemental Direct Testimony, Page 15 Lines 7-9.

<sup>24</sup> Mr. Conwell's Supplemental Direct Testimony, Page 10 Lines 3-5.

CONFIDENTIAL

1           Specifically, the CALEA feature is required by law to be implemented in voice  
2           switching systems. Many of our clients deploy Centrex services and the mobile-  
3           to-land traffic could terminate to one of these lines. Therefore, both CALEA and  
4           Centrex are included as part of the total cost of the switching system.

5   **Q32. Can you please address Mr. Conwell's statement that "the Commission**  
6   **should assure that Beresford, and any other RLECs with similar SDN**  
7   **connections, are not basing transport electronics costs on embedded plant in**  
8   **service"**<sup>25</sup>?

9   A32. Several of the RTC's, including Beresford, McCook, Santel, and West River,  
10   have equipment that is part of the SDN Communications network. This  
11   equipment is utilized to provide transport of traffic to the access tandem provider.  
12   The SDN Communications network is a very large and complicated network.  
13   Due to the manner in which it is architected, the equipment configuration at a site  
14   can impact the required equipment configuration for all other sites on the  
15   network. Therefore, it is not possible to develop a forward looking cost estimate  
16   for a particular site without redesigning the entire SDN network. This would be a  
17   very difficult and overly burdensome process for each of the RTC's. The only  
18   feasible method to provide estimated costs for the equipment that is part of the  
19   SDN Communications network is to utilize the actual costs for the existing  
20   electronics.

21

---

<sup>25</sup> Mr. Conwell's Supplemental Direct Testimony, Page 19 Lines 9-11.

CONFIDENTIAL

1 **Q33. Please address Mr. Conwell's statement in regards to the *line* portion of**  
2 **transport electronics investment in each exchange that consist of two OC-192**  
3 **optical interface cards when he states, "The RLECs must demonstrate that**  
4 **these large OC-192 rings are justified based on total demand; otherwise,**  
5 **smaller bandwidth rings with lower cost optical interface cards should be**  
6 **reflected in transport costs and rates"<sup>26</sup>? Please explain.**

7 A33. The FLEC engineering model was designed to accommodate the current and  
8 future demand for the inter-exchange transport network. Typically, fiber optic  
9 transport networks are designed for a 7 to 10 year life. In order for the system to  
10 be useful for this period of time, it is necessary to design the network to meet  
11 future bandwidth requirements. While it is difficult to predict future demand, it is  
12 important to note past and current trends. From 2001 through 2004, a majority of  
13 the SONET transport networks in which I was involved in the design and  
14 implementation were OC-48 networks. These systems typically were being  
15 deployed to replace asynchronous or OC-12 systems that were out of capacity.  
16 Since 2005, approximately 95 percent of the deployments conducted by Vantage  
17 Point have been OC-192 (or 10 Gbps) networks. These OC-192 system have  
18 been implemented to replace OC-12 or OC-48 systems that no longer have  
19 sufficient capacity. In fact, some systems that were deployed in the 2001/2002  
20 timeframe are presently being overlaid with 10 Gbps transport. Companies that  
21 have deployed 10 Gbps transport networks, or are in the process of deploying 10  
22 Gbps networks, include Alliance, Santel, and West River.

---

<sup>26</sup> Mr. Conwell's Supplemental Direct Testimony, Page 20 Lines 4-7.

CONFIDENTIAL

1           If OC-12 or OC-48 systems were deployed today, it is highly likely that  
2           the capacity of the systems will be exhausted well within the 7 to 10 year life of  
3           the equipment. When this happens, the transport network will need to be replaced  
4           or augmented with additional capacity. Replacing or augmenting the network will  
5           increase the total investment required for the network. Therefore, OC-12 and  
6           OC-48 networks are view to be inefficient for forward looking designs.

7   **Q34. Please address Mr. Conwell's statement in regards to 10/100 Base T and**  
8   **Gigabit Ethernet data interface cards and that the *tributary* portion of**  
9   **transport electronics investment includes additional investment amounts for**  
10   **data interface cards when he states, "The RLECs must demonstrate that**  
11   **these investments are necessary for or attributable to the transport of Alltel's**  
12   **mobile-to-land traffic in compliance with FCC rule §51.505(b)"<sup>27</sup>?**

13   A34. The purpose of the 10/100 BaseT and the Gigabit Ethernet data interface cards for  
14   the transport portion of the network is to provide Ethernet connectivity between  
15   the respective locations. As shown in my direct testimony in Exhibit NW-D-2, it  
16   is necessary to have connectivity between the centralized Call Agents and the  
17   Media Gateways for the purpose of call control. This connectivity is provided via  
18   the use of Ethernet interfaces. Without the Ethernet connectivity, the proposed  
19   switching system would not be able to terminate calls from outside the exchange,  
20   including mobile-to-land traffic.

---

<sup>27</sup> Mr. Conwell's Supplemental Direct Testimony, Page 21 Lines 1-3.

1 **Q35. Mr. Conwell states that “The RLECs still have not proven that the selected**  
2 **components represent the lowest cost, most efficient configuration; and, they**  
3 **have not proven that component quantities have been efficiently sized based**  
4 **on projected total demand, including the RLECs’ own traffic and transit**  
5 **traffic.”<sup>28</sup> Do you agree with Mr. Conwell’s statement? Please explain.**

6 A35. No. Sufficient information has been provided to show that the proposed network  
7 for the FLEC engineering model was developed using sound engineering  
8 practices and efficient architectures. In addition, the RTC’s have provided a  
9 detailed equipment list that provides a description of each component, a quantity  
10 of each component, and a per-unit investment total for the base cost, line cost, and  
11 tributary cost of the Inter-exchange Transport Electronics. This level of  
12 information provides more than adequate detail to enable Alltel to test the design.

13 **Q36. Do you agree with Mr. Conwell when he indicates that for West River,**  
14 **“portions of the investments at Regen Hut, Reva, and the Bison/SDN nodes**  
15 **likely should be removed from transport and termination costs”<sup>29</sup>? Please**  
16 **explain.**

17 A36. No. The Regen Hut is a transport electronics terminal that is necessary in order to  
18 complete the diverse fiber optic transport ring for West River. Due to the  
19 substantial fiber distances between Camp Crook and Nisland, the fiber optic  
20 transport signal must be regenerated. In addition, the Reva transport electronics is  
21 part of the overall transport network for West River. This equipment serves a

---

<sup>28</sup> Mr. Conwell’s Supplemental Direct Testimony, Page 21 Lines 10-14.

<sup>29</sup> Mr. Conwell’s Direct Testimony, Page 55 Lines 3-5.

CONFIDENTIAL

1 remote office in the Sorum exchange, and West River currently has transport  
2 electronics in this location that was implemented along with their OC-192  
3 SONET transport network. The Bison/SDN terminal provides transport  
4 connectivity to the SDN network, and it is considered an integral part of the  
5 overall fiber optic transport network for West River.

6 **Q37. Do you agree with Mr. Conwell when he states “The capacity and investment**  
7 **in transport electronics equipment are determined not just by the quantity of**  
8 **circuits, but also their bandwidth”<sup>30</sup>? Please explain.**

9 A37. No. The investment for transport electronics is related to the type(s) of tributary  
10 circuit interface cards (e.g. DS-1, DS-3, OC-3, etc.) equipped on the system, but  
11 there is not a linear relationship between the cost of a circuit interface card and  
12 the bandwidth supported on a specific interface card. For example, a 4-port  
13 OC-12 card has an equivalent bandwidth to a 1-port OC-48 card, but the pricing  
14 for these two interface cards is different. Typically, the cost per unit of bandwidth  
15 (in Mbps) is far greater for DS-1 circuit interface cards than for OC-12 circuit  
16 interface cards. In addition, the DS-1 circuit interface cards consume more slots  
17 in the SONET transport terminal per unit of bandwidth than other interface types  
18 such as an OC-12.

19

---

<sup>30</sup> Mr. Conwell's Direct Testimony, Page 57 Lines 11-12.

CONFIDENTIAL

1 **Q38. Do you agree with Mr. Conwell in comparison to a voice trunk (DS-0) when**  
2 **he states, “A DS-1 special circuit on the same interface card has a unit**  
3 **investment 24 times greater, or \$195”<sup>31</sup>? Please explain.**

4 A38. No. Mr. Conwell makes an invalid assumption when he performs the calculation.  
5 In order to assume that a DS-1 special circuit has a unit investment 24 times  
6 greater than a DS-0 circuit, one must assume that a 100 percent fill has been  
7 achieved on the circuit interface cards. In other words, the 28 port DS-1 interface  
8 cards must be fully populated with 28 DS-1 circuits. In addition, any DS-1  
9 circuits would have to be 100 percent filled with 24 DS-0 circuits in order to  
10 make his assumption correct. Especially for rural telecommunications service  
11 providers such as the RTC’s for whom this study was conducted, it is extremely  
12 rare for the quantity of DS-0 special circuits being provided by a company to be  
13 in multiples of 24.

14 **Q39. Do you agree with Mr. Conwell when he states “consideration should be**  
15 **given to basing transport costs on a smaller system, such as an OC-48 or**  
16 **OC-12 transport system”<sup>32</sup>? Please explain.**

17 A39. Absolutely not. This is intended to be a forward looking engineering model for  
18 the proposed networks. It is my experience that OC-12 rings are not deployed  
19 today for new core transport rings. In addition, it is extremely rare that OC-48  
20 rings are currently being placed in service. The typical OC-48 network elements  
21 that are being installed today are for additions to existing networks. I have been

---

<sup>31</sup> Mr. Conwell’s Supplemental Direct Testimony, Page 24 Lines 3-4.

<sup>32</sup> Mr. Conwell’s Direct Testimony, Page 67 Lines 4-5.

CONFIDENTIAL

1 involved in the engineering of many optical transport networks consisting of  
2 hundreds of nodes that are presently in service. Since 2002, approximately 60  
3 percent of the network elements that have been, or are in the process of being,  
4 placed into service for Vantage Point projects have been 10 Gbps transport  
5 implementations (e.g. OC-192 or 10 Gigabit Ethernet). Furthermore,  
6 approximately 95 percent of the network elements that Vantage Point has  
7 deployed, or is in the process of deploying, for our clients since 2006 have been  
8 10 Gbps transport systems. Many of our clients who deployed OC-48 networks in  
9 the 2002 to 2003 timeframe are finding that they no longer have sufficient  
10 transport capacity. Therefore, they are presently planning the replacement or  
11 augmentation of these OC-48 SONET networks with 10 Gbps transport systems.  
12 We typically design the fiber optic transport networks to be in service for  
13 approximately 7 to 10 years. If many companies are finding OC-48 networks  
14 insufficient today, then one can only conclude that the use of an OC-12 or OC-48  
15 network for the FLEC models is not forward looking.

16 **Q40. Mr. Conwell states that “The cable mileages used in the cost study for five**  
17 **companies are significantly longer than current interoffice mileages.”<sup>33</sup>**

18 **Please explain the reason for this.**

19 A40. The design methodology for the RTC FLEC engineering model was developed to  
20 comply with South Dakota Codified Law, Chapter 49-31-60, by enabling  
21 switched survivable transport rings. In order to comply with this requirement, the  
22 design incorporated the use of diversely routed fiber optic cables in order to

---

<sup>33</sup> Mr. Conwell’s Direct Testimony, Page 75 Lines 11-12.

CONFIDENTIAL

1 provide the necessary resiliency. An exhibit depicting the fiber optic cable  
2 routing for Alliance, Kennebec, McCook, Santel, and West River can be found in  
3 Exhibit NW-R-1 through Exhibit NW-R-5. As shown in these respective  
4 exhibits, the shortest and most probable routing was assumed.

5 With regards to the reason for the differences between the cable mileages  
6 in the cost study and the current interoffice mileages, there are several factors that  
7 may contribute to this variation. First, it is possible that some of these companies  
8 have not completed their long-term plan for fiber optic transport upgrades to  
9 allow their network to have fully diverse fiber routing. For these segments that  
10 are not diverse, the fiber optic cable distances may be shorter than for the  
11 diversely routed cable design for the FLEC engineering model. In addition,  
12 several of these companies may have leased fibers from other service providers or  
13 deployed joint fiber rings with other companies. Within our client base, several  
14 companies have deployed joint fiber rings with neighboring service providers as a  
15 short-term solution to providing diverse fiber optic cable routes. In many cases,  
16 our clients are constructing additional routes to move away from the joint fiber  
17 rings due to various reasons. The FLEC engineering models assumed that the  
18 RTC's would construct their own diversely routed fiber optic cable network for  
19 their intra-company, inter-exchange transport needs.

20 A minor anomaly was discovered in the fiber optic cable distances used in  
21 the FLEC engineering design for Santel. Two numbers were inadvertently  
22 transposed for the rural fiber distance between Parkston and Tripp. The actual  
23 fiber distance is 12.5 miles, but 21.5 miles was used. This issue has been

CONFIDENTIAL

1 corrected, along with a slight increase in the fiber miles to Artesian since the CO  
2 is outside the town. The updated OSP investment estimates were provided to  
3 Consortia, and Mr. Eklund will describe the insignificant impacts to the FLEC  
4 model for Santel in his testimony.

5 **Q41. Does that conclude your rebuttal testimony?**

6 A41. Yes. However, I wish to reserve the opportunity to supplement this testimony in  
7 the future, if necessary.
